FITE-EHD Introduction to European Economic History Z,ZK 3 he course introduces a selection of themes from European economic history. It gives the student basic knowledge about forming of the global economy through the description of the key historical periods. As European countries have been dominant actors in this process it focuses predominantly on their roles in economic history. From the large economic area of the Roman Empire to the fragmentation of the Middle Ages, from the destruction of WWII to the current affairs, the development of modern financial institutions is deciphered. The course does not cover the detailed economic history of particular European countries but rather the impact of trade and the role of particular events, institutions and organizations in history. Class meetings will consist of a mixture of lectures and discussions. FITE-SEP World Economy and Business Z,ZK The course introduces students of technical universities to international business. It does that predominantly by comparing individual countries and key regions of the world economy. Students get to know about different religions and cultures, necessary for doing business in diverse societies as well as indexes of economic freedom, corruption and economic development, which are needed for the right investment decision. Seminars help to improve knowledge in the form of discussions based on individual readings MI-SCE1 Seminá po íta ového inženýrství I Seminá po íta ového inženýrství je výb rový p edm t pro studenty, kte í se cht jí zabývat hloub ji tématy íslicového návrhu, spolehlivosti a odolnosti proti poruchám a útok m. Ke student m se v rámci p edm tu p istupuje individuáln a každý student i skupinka student eší n jaké zajímavé aktuální téma s vybraným školitelem. Sou ástí p edm tu je práce s v deckými lánky a jinou odbornou literaturou a/nebo práce v laborato ích K N. Kapacita p edm tu je omezena možnostmi u itel seminá e. Probíraná témata jsou pro každý semestr nová. MIE-MZI Mathematics for data science Z.ZK In this course, the students are introduced to the domains of mathematics necessary for understanding the standard methods and algorithms used in data science. The studied topics include mainly: linear algebra (matrix factorisations, eigenvalues, diagonalization), continuous optimisation (optimisation with constraints, duality principle, gradient methods) and selected notions from probability theory and statistics. Pokro ilé techniky strojového u ení NI-AML Z,ZK 5 P edm t seznamuje studenty s vybranými pokro ilými tématy strojového u ení a um lé inteligence a jejich aplikace na reálné problémy. Témata p edstavují techniky v oblasti doporu ovacích systém , zpracování obrazu, ízení i propojení fyzikálních zákon s oblastí strojového u ení. Cílem cvi ení je podrobn seznámit studenty s probíranými metodami. Digital drawing P edm t má za cíl p iblížit student m základní principy digitální kresby a grafické tvorby. Studenti získají pov domí o základech kompozice, perspektivy i teorie barev, což následn budou aplikovat ve svých samostatných pracích. Studenti také získají zkušenosti s kresbou v pr b hu praktických cvi ení. Kurz je vhodný pro kohokoli s chutí více kreslit a malovat, jelikož práv to je nedílnou sou ástí výuky. P edm t bude organizovaný formou tematických cvi ení pokrývajících ást teorie a tv r ích cvi ení, která jsou zam ena na procvi ování. Design Sprint Studenti budou pracovat metodou design sprint, vyvinutou p vodn spole ností Google, díky které lze b hem 5 dn p ejít od nápadu p es testování až k finálnímu návrhu produktu nebo služby. B hem kurzu se seznámí s metodou Design Sprint z pohledu ú astníka. Na praktickém problému si vyzkouší celý 5ti denní proces od výzkumu po testování prototyp . Díky za azení p ed za átek semestru mají studenti možnost vyzkoušet si metodu, která vyžaduje kontinuáln jší asovou alokaci než b žná výuka. NI-GLR Games and reinforcement learning The field of reinforcement learning is very hot recently, because of advances in deep learning, recurrent neural networks and general artificial intelligence. This course is intended to give you both theoretical and practical background so you can participate in related research activities. Presented in English. NI-GRI **Grid Computing** Z.ZK 5 Grid computing and gain knowledge about the world-wide network and computing infrastructure. NIE-ADM Data Mining Algorithms Z.ZK 5 The course focuses on algorithms used in the fields of machine learning and data mining. However, this is not an introductory course, and the students should know machine learning basics. The emphasis is put on advanced algorithms (e.g., gradient boosting) and non-basic kinds of machine learning tasks (e.g., recommendation systems) and models (e.g., kernel methods). Middleware Architectures 2 5 Students will learn new trends and technologies on the Web including theoretical foundations. They will gain an overview of Web application architectures, concepts and technologies for microservices, distrubuted cache and databases, smart contracts, realtime communication and web security. NIE-ARI Z.ZK Computer arithmetic 4 Students will learn various data representations used in digital devices and will be able to design arithmetic operations implementation units. NIE-BLO Blockchain Students will understand the foundations of blockchain technology, smart contract programming, and gain an overview of most notable blockchain platforms. They will be able to design, code and deploy a secure decentralized application, and assess whether integration of a blockchain is suitable for a given problem. The course places an increased emphasis on the relationship between blockchains and information security. It is concluded with a defense of a research or applied semester project, which prepares the students for implementing or supervising implementation of blockchain-based solutions in both academia and business. **NIE-BPS** Z.ZK Wireless Computer Networks Students will learn about the modern technologies, protocols, and standards for wireless networks. They will understand the routing mechanisms in ad-hoc networks, multicast and broadcast mechanisms, and data flow control mechanisms. They will also learn about principles of communication in sensor networks. They get knowledge of security mechanisms for wireless networks and get skills of configuration of wireless network elements and simulation of wireless networks using suitable tools NIE-CPX Complexity Theory 7.7K 5 Students will learn about the fundamental classes of problems in the complexity theory and different models of algoritms and about implications of the theory concerning practical (in)tractability of difficult problems. Web Data Mining Students will learn latest methods and technologies for web data acquisition, analysis and utilization of the discovered knowledge. Students will gain an overview of Web mining techniques for Web crawling, Web structure analysis, Web usage analysis, Web content mining and information extraction. Students will also gain an overview of most recent developments in the field of social web and recommendation systems. NIE-DIP Diploma Project 30 Z,ZK NIE-DVG Introduction to Discrete and Computational Geometry 5 The course intends to introduce the students to the discipline of Discrete and Computational Geometry. The main goal of the course is to get familiar with the most fundamental notions of this discipline, and to be able to solve simple algorithmic problems with a geometric component. Efficient Text Pattern Matching Z.ZK 5 Students get knowledge of efficient algorithms for text pattern matching. They learn to use so called succinct data structures that are efficient in both access time and memory complexity. They will be able to use the knowledge in design of applications that utilize pattern matching. **NIE-GAK** Graph theory and combinatorics Z,ZK 5 The goal of the class is to introduce the most important topics in graph theory, combinatorics, combinatorial structures, discrete models and algorithms. The emphasis will be not only on undestanding the basic principles but also on applications in problem solving and algorithm design. The topics include: generating functions, selected topics from graph and hypergraph

	theory, introduction to probabilistic method, properties of various special classes of graphs and combinatorial structures. The theory w of combinatorics on words, formal languages and bioinformatics.	viii be also applied	in the fields

NIE-HSC	Side-Channel Analysis in Hardware	Z,ZK	4
This course is de	edicated to so-called side-channel information leakage in hardware devices. It focuses on both theoretical analysis and practical attack	ks. Students get fa	miliar with
various kinds of s	ide channels and they get deeper insight in power attacks. Students learn to implement various profiled and non-profiled attacks and	get familiar with hi	gher-order
	They also get practice in both designing the SCA countermeasures and analyzing the amount and characteristics of the side-channel	information leakag	
NIE-KOD	Data Compression	Z,ZK	5
	oduced to the basic principles of data compression. They will learn the necessary theoretical background and get an overview of data	•	•
used in practice. It	he overview covers principles of integer coding and of statistical, dictionary, and context data compression methods. In addition, stude lossy data compression methods used in image, audio, and video compression.	ents learn the fund	amentals of

Such a polynomial time preprocessing is then a suitable first step, whatever is the subsequent solution eterized algorithm design methods and we will also show how to prove that for some problem (and parameter) such an algorithm (pre will also not miss out the relations to other approaches to hard problems such as moderately exponential algorithms or approximation.  Practical Deep Learning signed to provide students with a comprehensive understanding of Deep Learning using PyTorch to solve real-world problems in fields such a language processing.  Parallel and Distributed Programming  Parallel and Distributed Programming  Parallel and Distributed Programming  Parallel and Distributed Programming of Shared and distributed memory computers. They get acquianted with fundamental parallel algorithms and or so of design of efficient and scalable parallel algorithms and methods of performance evaluation of their implementations. The course practical programming of shared and distributed memory compu	sses, switching contecture with emphang system.  Z,ZK sary to solve these e can find a common tially in this (small me preprocessing on method. We will esumably) does not a schemes.  KZ sarning framework. The search of the sea	ntext, virtual asis on the  4 problems on property parameter of the input, present a ot exist. We  5 Throughout and natural  6 ng systems acquainted ages and s, they will er project of  5 f individual n be applied and practical  5 to pattern aspects.  4
This course is focus memory, system  NIE-PAM There are many exactly in practice (parameter) of the interest and polynomially in which is not possible plethora of parameter plethora is designed in the course, student plethora plethor	sed on the design and implementation of the basic components that make up modern operating systems. This includes threads, proce calls, interrupts and interactions of SW and HW using drivers. Students will learn the theory of the concept of operating system archite kernel architecture. Within the course, they will gain practical experience with the development of a small but fully functional operating. Parameterized Algorithms  optimization problems for which no polynomial time algorithms are known (e.g. NP-complete problems). Despite that it is often necess to the will demonstrate that many problems can be solved much more effectively than by naively trying all possible solutions. Often on inputs from practice-e.g., all solutions are relatively small. Parameterized algorithms exploit that by limiting the time complexity exponents the input size (which can be huge). Parameterized algorithms also represent a way to formalize the notion of effective polynomial time input size (which can be huge). Parameterized algorithms also represent a way to formalize the notion of effective polynomial time preprocessing is then a suitable first step, whatever is the subsequent solution beterized algorithm design methods and we will also show how to prove that for some problem (and parameter) such an algorithm (pre will also not miss out the relations to other approaches to hard problems such as moderately exponential algorithms or approximation.  Practical Deep Learning signed to provide students with a comprehensive understanding of Deep Learning using PyTorch to solve real-world problems in fields such a language processing.  Parallel and Distributed Programming  mputer architectures is primarily influenced by the shift of the Moore's law into parallelization of CPUs at the level of computing cores to parallel and distributed computing of shared and distributed memory computers. They get acquianted with fundamental parallel algorithms and or sof design of efficient and scalable parallel algorithms and methods of performance	sses, switching contecture with emphang system.  Z,ZK sary to solve these e can find a common tially in this (small me preprocessing on method. We will esumably) does not a schemes.  KZ sarning framework. The search of the sea	thext, virtual asis on the 4 problems on property parameter of the input, present a ot exist. We 5 Throughout and natural 6 ng systems acquainted ages and s, they will er project of 5 f individual n be applied and practical 5 to pattern aspects. 4 ks. Students

	professional literature and/or work in K N laboratories. The capacity of the subject is limited by the possibilities of the seminar teacher	3. The topics are i	new ioi eaci
	semester.		
NIE-SCE2	Computer Engineering Seminar Master II	Z	4
The Seminar of Co	omputer Engineering is a (s)elective course for students who want to deal with deeper topics of digital design, reliability and resistance to	failures and attac	ks. Students
are approached i	ndividually within the subject. Each student or group of students solves some interesting topic with the selected supervisor. Part of the	subject is work w	ith scientific
articles and other	professional literature and/or work in K N laboratories. The capacity of the subject is limited by the possibilities of the seminar teacher	rs. The topics are i	new for each
	semester.		
NIE-SEP	World Economy and Business	Z,ZK	4
The course intro	duces students of technical university to the international business. It does that predominantly by comparing individual countries and k	ey regions of worl	d economy.
Students get to	know about different religions and cultures, necessary for doing business in diverse societies as well as indexes of economic freedom	n, corruption and	economic
development, whi	ch are needed for the right investment decision. Seminars help to improve on the knowledge in the form of discussions based on indiv	idual readings. It i	s advised to
	take bachelor level of this course BIE-SEP as a prerequisite.		
NIE-SWE	Semantic Web and Knowledge Graphs	Z,ZK	5
The students wil	learn the most recent concepts and technologies of the Semantic Web. The course will provide an overview of the Semantic Web tec		
	hearn the most recent concepts and technologies of the beniantic web. The course will provide an overview of the beniantic web technologies	hnologies, method	ds and best
