

Study plan

Name of study plan: **Stavební inženýrství - pozemní stavby, specializace Projektování pozemních staveb**

Faculty/Institute/Others:

Department:

Branch of study guaranteed by the department: Welcome page

Garantor of the study branch:

Program of study: Civil Engineering - Building Engineering

Type of study: Follow-up master full-time

Required credits: 90

Elective courses credits: 0

Sum of credits in the plan: 90

Note on the plan: platí pro nástup od akad. roku 2023/24

Name of the block: Compulsory courses

Minimal number of credits of the block: 48

The role of the block: Z

Code of the group: NC20230101

Name of the group: Projektování pozemních staveb, 1. semestr

Requirement credits in the group: In this group you have to gain at least 23 credits

Requirement courses in the group: In this group you have to complete at least 6 courses

Credits in the group: 23

Note on the group:

Code	Name of the course / Name of the group of courses (in case of groups of courses the list of codes of their members) Tutors, authors and guarantors (gar.)	Completion	Credits	Scope	Semester	Role
101MAPS	Mathematics PS Jana Nosková, Michal Zdražil, Iva Malechová, Jozef Bobok Jana Nosková Jana Nosková (Gar.)	Z,ZK	3	2P+1C	Z	z
124PS4C	Building Structures 4 Vladimír Žára, Haňa Gattermayerová, Tomáš Mejka, Ctislav Fiala Vladimír Žára Vladimír Žára (Gar.)	Z,ZK	4	2P+2C	Z	z
124INBB	Integrated Design of Buildings Jan Říčka, Petr Hájek, Antonín Lupíšek Antonín Lupíšek Petr Hájek (Gar.)	Z,ZK	4	2P+1C	Z	z

Characteristics of the courses of this group of Study Plan: Code=NC20230101 Name=Projektování pozemních staveb, 1. semestr

101MAPS	Mathematics PS Focused on basic and more advanced statistical and probabilistic methods of data analysis as well as on hypothesis testing and regression.	Z,ZK	3
124PS4C	Building Structures 4	Z,ZK	4
124INBB	Integrated Design of Buildings The main objective of the subject Integrated Building Design is to get an complex overview of the principles of integrated buildings design, life cycle assessment of buildings, evaluation of building performance, green/sustainable certification systems and understand environmental, social and economic aspects of the built environment.	Z,ZK	4
133BOKO	Concrete and Masonry Structures 1	Z,ZK	4
124KOSD	Complex Structural Detail The aim of the course is to extend the knowledge gained in previous courses - it is intended for students who have already reached advanced level of knowledge about structural problems in buildings. The content of the course is focused on the complex solution of construction details, following all legislative requirements and taking into account the maximum efficiency and durability of the chosen solution.	KZ	3

124P03C	Structural Design 3C	KZ	5
The student processes selected parts of the project documentation of either the new construction of an advanced building (assignment "N") or the refurbishment of an older building (assignment "R"). In the first phase, the student proposes a design solution concept and a basic solution of broader relationships (N) or processes a simplified documentation of the current state of the building and an analysis of broader relationships (R). It also optimizes variants of the construction solution (N) or evaluates the construction and technical condition of the specified object - STP (R). In the next phase, he will carry out a conceptual design of construction details (N) or an analysis of faults and their causes - STP (R). It also processes selected parts of the project documentation of the building or its parts (N) or drafts selected rehabilitation measures (R)			

Code of the group: NC20230201

Name of the group: Projektování pozemních staveb, 2. semestr

Requirement credits in the group: In this group you have to gain at least 25 credits

Requirement courses in the group: In this group you have to complete at least 7 courses

Credits in the group: 25

Note on the group:

Characteristics of the courses of this group of Study Plan: Code=NC20230201 Name=Projektování pozemních staveb, 2. semestr

135ZS02	Foundations 2	Z,ZK	4
The course deepens the knowledge from the previous course ZS1. It covers design principles, risks associated with the foundation of structures, deeper design of flat foundations, deeper design of deep foundations, negative casing friction of drilled piles, grouting (calculations and execution), construction pits, improvement of foundation soils.			
132DKBU	Diagnostics of Structures and Buildings	KZ	3
124TT2C	Thermal Engineering in Construction 2	KZ	3
Extension and completion of knowledge from the basic short course on thermal protection of buildings. Thermal transmittance of windows and curtain walls, linear and point thermal transmittance, ventilated constructions, energy performance of buildings and building energy performance certificate, thermal stability of rooms and risk of overheating, thermal protection of historic buildings.			
124PDR2	Failures, Deterioration, Renovations 2	Z,ZK	4
As part of the course, students will become familiar with the structural statics and analytical problems of failures, rehabilitation and restoration of load-bearing and completion structures of historical buildings, including the influence of fire resistance requirements, health safety and building physics. The lectures, structured into thematic areas, will mainly cover the areas of damage and repair of brick tenement houses, rural buildings, industrial buildings, objects realized with prefabricated technology, damage and repair of opening fillings (windows, doors), floor structures, chimneys and staircases of historical buildings.			
124DRS	Timber Constructions	Z,ZK	3
Students will learn about the complex issues of designing modern wooden buildings. The introductory block of lectures is dedicated to the material base, structural systems, and mechanical properties of wood and wood-based materials. The principles of ensuring spatial rigidity of the light frame and mass-timber structural systems are presented. It follows a lecture block focused on the design of envelope constructions of wooden buildings, moisture safety, biological threats, and principles of wood protection. In the following two lectures, the structure of wood and the interaction of the wood substance with air humidity, which has a significant effect on all technical properties of wood, are described in more detail. The next lecture is devoted to passive measures to reduce the risk of summer overheating of wooden buildings. In the last lecture, construction technology is discussed and a comprehensive approach to the design of modern wooden buildings is emphasised.			
132DYKC	Dynamics of Building Structures	Z,ZK	3
Principles of theory of vibration, dynamic loading. Free and forced vibration of single-degree-of-freedom systems. Damped vibration. Methods of dynamic analysis of multi-degree-of-freedom systems.			
124P04C	Structural Design 4C	KZ	5
The student processes selected parts of the project documentation of either the new construction of an advanced building (assignment "N") or the refurbishment of an older building (assignment "R"). In the first phase, the student proposes a design solution concept and a basic solution of broader relationships (N) or processes a simplified documentation of the current state of the building and an analysis of broader relationships (R). It also optimizes variants of the construction solution (N) or evaluates the construction and technical condition of the specified object - STP (R). In the next phase, he will carry out a conceptual design of construction details (N) or an analysis of faults and their causes - STP (R). It also processes selected parts of the project documentation of the building or its parts (N) or drafts selected rehabilitation measures (R)

Characteristics of the courses of this group of Study Plan: Code=NC20230101_2 Name=Projektování pozemních staveb, PV p edm ty, 1. semestr

102YFPL	Solid State Physics in Civil Engineering	Z	2
Solids, crystal structure, atomic shell theory, valence layer chemical bonds, dislocation disturbances, critical crack energy, vibration of masses, systems natural frequency of vibration and damped vibration, basics concepts of fracture mechanics, types of fracture, electron microscopes, scanning tunneling microscope, atomic force microscope, diffraction, diffraction methods, semiconductors, p-n junction, photovoltaic effect, solar cells, heat and moisture transport.			
122YTSD	Technology of Component Production	Z	2
124YADO	Acoustics and Daylighting of Buildings	Z	2
The course focuses on a more detailed explanation and practice of selected topics in the field of daylighting and building acoustics that students may encounter in future design practice.			
124YCPV	The Principles of Circular Economy in Building Construction	Z	2
124YDPH	Diagnosis and Surveying of Building Structures	Z	2
Course sets out key considerations and implications which require structure assessment. The course provides an objective framework and methodical and systematic approach to surveying (structural diagnosis, preliminary and comprehensive survey, visual inspection, site inspections, laboratory tests, investigation kits, types of defects and damages, symptoms, manifestation, significance, criticality, reason for failures case studies)			

124YDSR	Demolitions of Buildings and Material Recycling	Z	2
The use of construction waste from demolitions from the production of building materials and from other sectors in the construction industry with the aim of: significantly reducing the volumes of landfilled materials, reducing the consumption of primary raw materials, a new perspective on the design of buildings and structures in accordance with a closed life cycle. Legislation, levels of recycling in developed countries, recycling in CR, possibilities of recycling buildings and structures, design of structures from the point of view of sustainable development, minimization of landfills, examples and demonstrations of recycling technologies, low-waste technologies			
124YPBS	Principles of Building Fire Safety	ZK	2
The course is focused on the presentation and acquisition of the most important concepts and principles of fire safety in buildings. Attention is paid to all the main components of fire safety design that are important for the protection of life and health, property, the environment and other assets. The course is intended for students of non-fire disciplines and should enable them to take into account aspects of fire safety from the initial stages of project preparation of buildings.			
124YPRS	Failures, Deterioration, Renovations	Z	2
The course is focused on the current issue of restoration, reconstruction and modernization of buildings (residential, industrial, etc.), on historical structures and materials, the issue of degradation and aging of structures and materials of historical buildings, their residual life and failures of historical buildings and their parts. An integral part is the issue of structural-technical and historical surveys, diagnostics and assessment of the structural-technical condition and remaining service life.			
125OZE1	Renewable Energy Sources	ZK	3
Renewable sources are becoming increasingly important sources of energy for buildings. Understanding their characteristics is key to the proper design and operation of these systems. The course therefore looks in detail at renewable sources and their applications.			
132PRPM	Deformation and Failure of Materials	Z,ZK	5
Viscoelasticity, models for concrete creep. Theory of plasticity, principles of limit and incremental analysis. Fracture mechanics. Damage mechanics.			
132YKPA	Statics for Architecture	Z	2
132YMMO	Modern Methods of Optimization	Z	2
The course is aimed at an overview of numerical optimization methods applicable not only in the Civil Engineering area. The emphasis is put more on the introduction of driving principles, however, practical applications in MATLAB environment are also conducted during exercises.			
132YSEI	Seismic Engineering	Z	2
Basic principles of design of earthquake resistant structures. Methods of calculating the response of structures to earthquake loads according to Eurocode 8.			
132YSSK	Reliability of Structures	Z	2
The course is devoted to the reliability of elements and systems. Element reliability is time dependent while the reliability of systems is of type strength-load. Complicated cases are solved by the FORM method. Two simulation methods are introduced: Monte Carlo and LHS.			
133YBEX	Concrete under Extreme Conditions	Z	2
The course is focused on concrete and concrete structures under extreme conditions.			
133YPRK	Failures and Rehabilitation of Concrete Structures	Z	2
The course focuses on the description of failures of concrete structures, explanation of the causes of these failures and the design of remedial measures. Methods of strengthening existing concrete structures are also discussed. Surface repairs, strengthening of contactors, strengthening of structural elements to the effects of bending moment and shear, and foundation structures are discussed. The course appropriately combines theoretical approaches with common practice.			
134YDKM	Timber structures and bridges	Z	2
Timber structures focused to national strategy of sustainable development. New timber-based materials. Structural systems of houses and bridges. Repairing and strengthening. Fire design. Production, protection, erection and maintenance. Design and evaluation of bridges, roofs structures in normal temperature and in fire.			
134YROK	Extending the Life of Steel and Timber Structures	Z	2
Materials used for bearing structures. Developments in the area of regulations and standardization. Causes of defects, malfunctions, survey of objects, static assumptions of reconstruction. Possibilities of strengthening, strengthening of steel and timber structures and strengthening of connections. Using of computers in reconstructions and development of numerical models.			
134YSMK	Stability and modelling of steel structures	Z	2
Subject YSMK covers two parts. The first one deals with stability and strength of steel plates, the second one with stability and strengths of steel frame structures. In the first part the historic collapses of steel structures are analysed including the importance of imperfections for a design of thin plated structures. Presented are principles of theory of buckling, linear and nonlinear theory of buckling of thin plates. The results are applied to the 4th class cross sections in harmony with Eurocode. Buckling due to normal, shear and local loadings including their combination is analysed in a detail. In the end the application of the results is shown together with design of necessary stiffeners. The second part is focused on member and structure stability. Possible global analysis methods are presented together with methods for compression and bending interaction for slender members. In detail, specific cases of lateral torsional buckling are explained including also tapered members.			
135YGSM	Geotechnical Software for Numerical modelling	Z	2
Students get acquainted with the Finite Element Method, the currently dominant tool for numerical modeling in Geotechnics. Emphasis is placed on introducing the basic principles of the Finite Element Method and their subsequent application to selected problems of Geotechnical Engineering. The course summarises the types of finite elements used in geotechnical applications, material models suitable for the description of soil deformation, and selected specifics associated with numerical modeling in geotechnics. This knowledge is further applied in the modeling of foundation, embedded walls, and stability problems.			
210YDSM	Diagnostics of Building Materials Properties	Z	2
Failures of building materials, mechanical, thermal, chemical and other influences on the development of failures of building materials. Diagnostics of their occurrence. Basics of experimental measurement and instrumentation of tested elements and structures. Theory of experiment, measurement and processing of results. Testing machines and equipment. Deformation measuring instruments. Destructive testing of mechanical properties. Non-destructive test methods. Test methodology for various materials (concrete, mortar, metallic elements, wood, glass, plastics, composites and others).			
210YSB	Special Concretes	Z	2
This course is aimed at expanding knowledge in the field of special concretes and composites for specific applications. The core of the course is to acquaint students with both the technological aspects of the production, testing and use of special concretes, as well as the applicable legislative framework for individual types of special concretes. Specific practical applications and experiences are also presented within the course.

Characteristics of the courses of this group of Study Plan: Code=NC20230201_2 Name=Projektování pozemních staveb, PV p edm ty, 2. semestr

101YFAV	Introduction to Functional Analysis and Variational Methods	KZ	2
101YMCD	Methods of Time Discretization	Z	2
The course is devoted to a universal and very effective method for solving problems involving time, the so-called evolutionary problems, especially for partial differential equations with a time variable. This method represents a modern approach to modeling and solving engineering tasks. These problems, both linear and non-linear, model events in many engineering fields, such as heat conduction, oscillations, also in rheology and other parts.			

101YMST	Mathematical statistics for technicians Inferential statistics. Theory of probability. Random variables and its characteristics. Basic methods of mathematical statistics.	Z	2
101YNUM	Numerical Methods Numerical computing in applied mathematics: course for beginners.	Z	2
123YMPU	Materials for Coatings Students will gain an overview of how to protect building structures from corrosion and other harmful influences such as UV radiation, acid rain, etc. Students will also learn about methods and technologies of surface treatment. The course consists of 6 lectures and 6 exercises. In the lectures, students will learn about both historical and more importantly modern surface treatments for different types of structures. In the exercises, students will perform a surface treatment on a fragment of a structure and will be able to check the quality of the work done by themselves in the last exercise by means of a tear-off test.	Z	2
124YHVK	Long Span Structures The subject deals with the analysis of structural solutions applied in building designs by the world's best architects. Although attention will be focused mainly on the solution of load-bearing structures, we will also pay attention to the wider context of the design. Reading existing constructions is a natural way to learn the principles of their design. And naturally we will learn from the best. An extensive database of completed buildings, including more than 5,000 buildings, will enable us to take a trip into history and the present on all the world's continents.	Z	2
124YKHK	Building Quality Complex Assessment Students will gain an overview of design strategies in green architecture and sustainable building and learn how to conduct assessments to achieve high quality buildings. In addition, they will learn basic information on life cycle assessment of materials and buildings.	Z	2
124YMOB	Modelling of Buildings - BIM The course is designed to introduce the phenomenon of parametric design, which is becoming very widespread in today's world. It is the connection of 3D models and BIM models with visual programming. Instead of writing code in a classical programming language, Nodes are connected, and the resulting script can be created visually and without knowledge of the programming language. These scripts can be used primarily for: - creating parametric geometry, - working with data in a BIM model, - structural and physical analysis, design optimization. Thematically, the course covers two main areas of parametric modeling, replicating two software platforms: Revit + Dynamo (JaVe) Rhino + Grasshopper (ZdMa)	Z	2
124YPSF	Precast concrete structures Residential houses made of precast concrete panels, of which approx. 82 thousand were built in the period 1960-1995 do not meet the required extent of the current dynamically developing society and in many cases require the implementation of regeneration and modernization interventions enabling their full use. The course is focused on the current issues of renewal, reconstruction and modernization of precast houses, modernization of apartments in precast houses, on the issue of freeing parterres of precast houses for services, shops, offices, fitness centers, etc. Renovation, modernization, or regenerations require the removal of functionally inadequate completion structures, technical equipment, installations and, in some cases, even demanding interventions in supporting structures. As part of the construction of communication networks, modernization of urban development, etc., it is necessary in some cases to carry out partial or complete demolition of a precast panel building. As part of the regeneration of precast panel housing estates, an extension is also carried out, or completion of precast houses. The implementation of the mentioned plans requires a survey and diagnostics of supporting and peripheral structures, joints of parts and an evaluation of the structural-technical condition and an assessment of the residual life of precast panel structures and buildings.	Z	2
124YPS5	Prefabricated structures	Z	2
124YRHS	Reconstruction of Historical Building Structures In the period from the second half of the 19th century by 1960, more than 250 thousand of two- to five-story brick apartment (mainly rental) houses in traditional brick technology were constructed in the Czech Republic. Brick buildings from this period were built according to regulations, building codes and laws from the turn of the 19th and 20th centuries. Multi-storey brick tenement houses do not meet the current thermal, acoustic and other requirements, the requirements of a dynamically developing society to the required extent, and in many cases require regeneration and modernization interventions, including the replacement of non-compliant and out-of-date structures and equipment enabling their further use. The course is focused on the current issue of renewal, reconstruction and modernization of brick multi-storey rental apartment buildings, on historical structures and materials, the issue of degradation and aging of structures and materials of historic brick residential buildings, their residual life, failures and reconstruction of historical buildings and their parts. Furthermore, the course is focused on the issue of improving the well-being of the internal environment, the replacement of finishing structures, opening fillings, etc. as an integral part of the modernization of these buildings.	Z	2
125YTCH	Technological Equipment of Buildings Sauna, fireplaces, kitchen technology, elevators, technology swimming pools, heat pumps, heat source and technological system, technology cooling, fire safety equipment, sprinklers.	Z	2
126YBVE	BIM in Public Investments	Z	2
126YPDV	Development Project	Z	2
132YNAK	Nonlinear Analysis of Materials and Structures Students become acquainted with the concepts of linear stability and calculation of elastoplastic load capacity. Linear stability - evaluation of the critical load and buckling shape. Analysis of structures according to the 2nd order theory - equilibrium conditions on a deformed structure, initial stress matrix. Elastoplastic analysis of structures - evaluation of the limit load capacity, distribution of internal forces at the limit state - static incremental method, kinematic method. Solving stability and elastoplasticity problems by means of a general-purpose finite element program.	Z	2
132YNA2	Numerical Analysis of Structures 2 Advanced course on finite element method. Formulation of plate elements suitable for thin and thick plates, plates on elastic foundation. Introduction to nonlinear problems: geometrical and material nonlinearity, solution methods, implementation aspects.	Z,ZK	4
132YPM2	Computer Analysis of Structures 2 Limit state of frames. Stability analysis of structures. Second order theory. Beams and gridwork girders on elastic foundation. Plate and wall structures. Dynamic analysis of structures. Verification of results.	Z	2
132YSHK	Statics and Reconstruction of Historical Structures Short overview of historical vaults and roof trusses. Static behaviour and most frequent causes of failure. Methods of reconstruction, changes in foundation conditions included. Most frequent causes of failure of panel buildings. Visit to the historical part of Prague Castle.	Z	2
132YUPM	General Principles of Mechanics Tensors, differential operators and their application in mechanics, Gauss and Green theorems. General structure of the basic equations of linear and nonlinear statics, energy and duality. Principle of virtual work (power), variational principles (Lagrange, Castigliano, Hellinger-Reissner, Hu-Washizu) and their application to continuous and discrete models of beams, frames, plates, walls and three-dimensional bodies.	Z,ZK	4
133YATK	Applied Theory of Structures Detailed introduction to theoretical approaches to the effects of creep and shrinkage on structures. Principles of time-dependent analysis. Methods for the analysis of thin-walled concrete structures, stability theory.	Z,ZK	4
133YMBV	Concrete and Masonry Structures 1 The content of the subject will be selected problems from the following areas: Reinforcement of discontinuities of reinforced concrete structures. Introduction to nonlinear modeling of reinforced concrete structures. Preparation of input data for numerical models. Design of structures using MATLAB. Presentation of selected programs for the design of concrete structures.	Z	2
133YPNB	Fire design of concrete and masonry structures The course is focused on fire resistance of concrete and masonry structures: concrete and concrete structures exposed to fire, design rules, thermal analysis, loads, design principles, design methods, material properties of concrete and steel reinforcement at high temperatures, fire design of masonry structures.	Z	2

133YVHB	Ultrahigh Performance Concretes	Z	2
The aim of the course is to present a special type of concrete that achieves great strength and high durability, which enables the realization of very thin structures. The components of high performance concrete are presented and the main differences in composition of ordinary concrete and HPC. A large part of the lectures is devoted to the components of high performance concrete, the composition and the method of manufacturing, which are subsequently accompanied by laboratory exercises, where the students can experience the theoretical knowledge in practical use.			
134YHNK	Stainless steel and aluminium structures	Z	2
Subject YHNK covers two parts: the first concerns design of structures from aluminium alloys, the second deals with stainless steel structures. Structures of aluminium alloys: Introduction and practice in designing of aluminium structures. Structures of stainless steel: Evolution of stainless steel materials/structures and examples of realized structures. Stainless steels suitable for structures are described in a detail, including their properties. Dissimilarities in assessments of members under common loadings with respect to low-carbon steels is described for both ultimate and serviceability limit states. In the end the possibilities concerning connections of stainless steel members, erection and installation of stainless steel members are described.			
134YNDK	Load-bearing timber roof constructions	Z	2
System of roofs structures. Creation of numerical models for assessment of internal forces and deformations for main different roof systems and structures. Analysis of the static function and behaviour of main individual elements and their design. Historic structures and their reconstruction. Designing typical structural details based on carpentry joints. We will discuss also using modern methods of joining elements of timber structures.			
134YNSK	Design of Glass Structures	Z,ZK	2
The subject is intended for students of the master's program Civil Engineering, deepens the knowledge acquired in the subject 134YNKS. Extension of theoretical knowledge in the field of stability of glass beams, columns and walls. Principles of designing structural elements made of glass according to normative documents, experimental verification of material properties of glass, safety glass, use of software support for designing.			
134YPMK	Design of Membrane Structures	Z	2
134YPOD	Fire Resistance of Steel and Timber Structures	Z	2
The class gives introduction to fire modeling, fire safety and fire resistance of steel, steel-concrete composite and timber structural elements.			
134YSOD	Connections of steel and timber structures	Z	2
The subject allows insight and ability to apply the knowledge related to structural connections and its application by software.			
134YSOK	Special steel structures	Z	2
Crane supporting structures - actions, design, detailing. Silos - actions, behaviour, silos with rigid and non-rigid section. Masts - division, detailing, design. Cable roofs - procedure of calculation.			
135YVPZ	Computer analysis in underground structures	Z	2
Numerical methods in CAD/CAM in geomechanics. Basic types of constitutive models of soil and rock mass behavior. Summary of PC geotechnical software both in the field of conventional methods and in numerical modelling domain. Practical solutions of selected geotechnical problems.			

Name of the block: Povinn volitelné p edm ty, doporu ení S1

Minimal number of credits of the block: 30

The role of the block: S1

Code of the group: NC20230300

Name of the group: Stavební inženýrství - pozemní stavby, diplomová práce

Requirement credits in the group: In this group you have to gain at least 30 credits

Requirement courses in the group: In this group you have to complete at least 1 course

Credits in the group: 30

Note on the group:

Characteristics of the courses of this group of Study Plan: Code=NC20230300 Name=Stavební inženýrství - pozemní stavby, diplomová práce

124DPM	Diploma Thesis	Z	30
The topics of diploma theses are based on the needs of practice or the scientific research activity of the department, the scope and difficulty corresponds to the student's knowledge acquired during the master's studies. The supervisor of the thesis can designate additional consultants to the student.			
132DPM	Diploma Thesis	Z	30
In accordance with the thesis proposal.			
133DPM	Diploma Thesis	Z	30
In accordance with a thesis proposal.			
134DPM	Diploma Thesis	Z	30
Design of steel / timber load bearing building structure according to external requirements in relation to interaction of load bearing and final completion structural elements. A study focused on research of load bearing structures may be also the topic of the the project. The project is assigned by a final project supervisor individually.			

135DPM	Diploma Thesis	Z	30
--------	----------------	---	----

In the diploma thesis, the student deals with a topic chosen by the department from those regularly announced by the department. It addresses, for example, problems related to the design and construction of geotechnical structures, civil engineering structures, special foundations for industrial, transport, housing and water management structures, earth and rock structures in complex cases and waste disposal structures. The thesis builds on and develops the findings of the thesis project.

Name of the block: Povinn volitelné p edm ty, doporu ení S3

124YPR1	Failures, Deterioration, Renovations 1	ZK	3
---------	--	----	---

As part of the course, students will learn about the mechanisms of degradation processes and failures of buildings according to the building materials used, structural statics and analytical issues of failures, rehabilitation and restoration of other load-bearing structures of historical buildings. The lectures, structured into thematic areas, will include in particular: familiarization with the principles and building codes applied in the construction solution of historical buildings and their parts, basic structural static and material issues of historical buildings, analysis of degradation processes, effects and influences of variables over time, which together with transportation processes affect the lifetime, durability and construction-technical condition of historical objects, methods and processes applied in the restoration and reconstruction of historical buildings, construction-technical condition of historical buildings and knowledge of diagnostic methods and procedures applied in the survey and monitoring of historical buildings.

129TYBC	Building Typology	Z	3

List of courses of this pass:

Code	Name of the course	Completion	Credits
101MAPS	Mathematics PS	Z,ZK	3

Focused on basic and more advanced statistical and probabilistic methods of data analysis as well as on hypothesis testing and regression.

101YFAV	Introduction to Functional Analysis and Variational Methods	KZ	2
101YMCD	Methods of Time Discretization	Z	2
The course is devoted to a universal and very effective method for solving problems involving time, the so-called evolutionary problems, especially for partial differential equations with a time variable. This method represents a modern approach to modeling and solving engineering tasks. These problems, both linear and non-linear, model events in many engineering fields, such as heat conduction, oscillations, also in rheology and other parts.			
101YMST	Mathematical statistics for technicians	Z	2
Inferential statistics. Theory of probability. Random variables and its characteristics. Basic methods of mathematical statistics.			
101YNUM	Numerical Methods	Z	2
Numerical computing in applied mathematics: course for beginners.			
102YFPL	Solid State Physics in Civil Engineering	Z	2
Solids, crystal structure, atomic shell theory, valence layer chemical bonds, dislocation disturbances, critical crack energy, vibration of masses, systems natural frequency of vibration and damped vibration, basics concepts of fracture mechanics, types of fracture, electron microscopes, scanning tunneling microscope, atomic force microscope, diffraction, diffraction methods, semiconductors, p-n junction, photovoltaic effect, solar cells, heat and moisture transport.			
122YTSD	Technology of Component Production	Z	2
123YMPU	Materials for Coatings	Z	2
Students will gain an overview of how to protect building structures from corrosion and other harmful influences such as UV radiation, acid rain, etc. Students will also learn about methods and technologies of surface treatment. The course consists of 6 lectures and 6 exercises. In the lectures, students will learn about both historical and more importantly modern surface treatments for different types of structures. In the exercises, students will perform a surface treatment on a fragment of a structure and will be able to check the quality of the work done by themselves in the last exercise by means of a tear-off test.			
124DPM	Diploma Thesis	Z	30
The topics of diploma theses are based on the needs of practice or the scientific research activity of the department, the scope and difficulty corresponds to the student's knowledge acquired during the master's studies. The supervisor of the thesis can designate additional consultants to the student.			
124DRS	Timber Constructions	Z,ZK	3
Students will learn about the complex issues of designing modern wooden buildings. The introductory block of lectures is dedicated to the material base, structural systems, and mechanical properties of wood and wood-based materials. The principles of ensuring spatial rigidity of the light frame and mass-timber structural systems are presented. It follows a lecture block focused on the design of envelope constructions of wooden buildings, moisture safety, biological threats, and principles of wood protection. In the following two lectures, the structure of wood and the interaction of the wood substance with air humidity, which has a significant effect on all technical properties of wood, are described in more detail. The next lecture is devoted to passive measures to reduce the risk of summer overheating of wooden buildings. In the last lecture, construction technology is discussed and a comprehensive approach to the design of modern wooden buildings is emphasised.			
124INBB	Integrated Design of Buildings	Z,ZK	4
The main objective of the subject Integrated Building Design is to get an complex overview of the principles of integrated buildings design, life cycle assessment of buildings, evaluation of building performance, green/sustainable certification systems and understand environmental, social and economic aspects of the built environment.			
124KOSD	Complex Structural Detail	KZ	3
The aim of the course is to extend the knowledge gained in previous courses - it is intended for students who have already reached advanced level of knowledge about structural problems in buildings. The content of the course is focused on the complex solution of construction details, following all legislative requirements and taking into account the maximum efficiency and durability of the chosen solution.			
124P03C	Structural Design 3C	KZ	5
The student processes selected parts of the project documentation of either the new construction of an advanced building (assignment "N") or the refurbishment of an older building (assignment "R"). In the first phase, the student proposes a design solution concept and a basic solution of broader relationships (N) or processes a simplified documentation of the current state of the building and an analysis of broader relationships (R). It also optimizes variants of the construction solution (N) or evaluates the construction and technical condition of the specified object - STP (R). In the next phase, he will carry out a conceptual design of construction details (N) or an analysis of faults and their causes - STP (R). It also processes selected parts of the project documentation of the building or its parts (N) or drafts selected rehabilitation measures (R)			
124P04C	Structural Design 4C	KZ	5
The student processes selected parts of the project documentation of either the new construction of an advanced building (assignment "N") or the refurbishment of an older building (assignment "R"). In the first phase, the student proposes a design solution concept and a basic solution of broader relationships (N) or processes a simplified documentation of the current state of the building and an analysis of broader relationships (R). It also optimizes variants of the construction solution (N) or evaluates the construction and technical condition of the specified object - STP (R). In the next phase, he will carry out a conceptual design of construction details (N) or an analysis of faults and their causes - STP (R). It also processes selected parts of the project documentation of the building or its parts (N) or drafts selected rehabilitation measures (R)			
124PDR2	Failures, Deterioration, Renovations 2	Z,ZK	4
As part of the course, students will become familiar with the structural statics and analytical problems of failures, rehabilitation and restoration of load-bearing and completion structures of historical buildings, including the influence of fire resistance requirements, health safety and building physics. The lectures, structured into thematic areas, will mainly cover the areas of damage and repair of brick tenement houses, rural buildings, industrial buildings, objects realized with prefabricated technology, damage and repair of opening fillings (windows, doors), floor structures, chimneys and staircases of historical buildings.			
124PS4C	Building Structures 4	Z,ZK	4
124PS5C	Building Structures 5	Z	3
124TT2C	Thermal Engineering in Construction 2	KZ	3
Extension and completion of knowledge from the basic short course on thermal protection of buildings. Thermal transmittance of windows and curtain walls, linear and point thermal transmittance, ventilated constructions, energy performance of buildings and building energy performance certificate, thermal stability of rooms and risk of overheating, thermal protection of historic buildings.			
124YADO	Acoustics and Daylighting of Buildings	Z	2
The course focuses on a more detailed explanation and practice of selected topics in the field of daylighting and building acoustics that students may encounter in future design practice.			
124YCPV	The Principles of Circular Economy in Building Construction	Z	2
124YDPH	Diagnosis and Surveying of Building Structures	Z	2
Course sets out key considerations and implications which require structure assessment. The course provides an objective framework and methodical and systematic approach to surveying (structural diagnosis, preliminary and comprehensive survey, visual inspection, site inspections, laboratory tests, investigation kits, types of defects and damages, symptoms, manifestation, significance, criticality, reason for failures case studies)			
124YDSR	Demolitions of Buildings and Material Recycling	Z	2
The use of construction waste from demolitions from the production of building materials and from other sectors in the construction industry with the aim of: significantly reducing the volumes of landfilled materials, reducing the consumption of primary raw materials, a new perspective on the design of buildings and structures in accordance with a closed life cycle. Legislation, levels of recycling in developed countries, recycling in CR, possibilities of recycling buildings and structures, design of structures from the point of view of sustainable development, minimization of landfills, examples and demonstrations of recycling technologies, low-waste technologies			

124YHVK	Long Span Structures	Z	2
The subject deals with the analysis of structural solutions applied in building designs by the world's best architects. Although attention will be focused mainly on the solution of load-bearing structures, we will also pay attention to the wider context of the design. Reading existing constructions is a natural way to learn the principles of their design. And naturally we will learn from the best. An extensive database of completed buildings, including more than 5,000 buildings, will enable us to take a trip into history and the present on all the world's continents.			
124YKHK	Building Quality Complex Assessment	Z	2
Students will gain an overview of design strategies in green architecture and sustainable building and learn how to conduct assessments to achieve high quality buildings. In addition, they will learn basic information on life cycle assessment of materials and buildings.			
124YMOB	Modelling of Buildings - BIM	Z	2
The course is designed to introduce the phenomenon of parametric design, which is becoming very widespread in today's world. It is the connection of 3D models and BIM models with visual programming. Instead of writing code in a classical programming language, Nodes are connected, and the resulting script can be created visually and without knowledge of the programming language. These scripts can be used primarily for: - creating parametric geometry, - working with data in a BIM model, - structural and physical analysis, design optimization. Thematically, the course covers two main areas of parametric modeling, replicating two software platforms: Revit + Dynamo (JaVe) Rhino + Grasshopper (ZdMa)			
124YPBS	Principles of Building Fire Safety	ZK	2
The course is focused on the presentation and acquisition of the most important concepts and principles of fire safety in buildings. Attention is paid to all the main components of fire safety design that are important for the protection of life and health, property, the environment and other assets. The course is intended for students of non-fire disciplines and should enable them to take into account aspects of fire safety from the initial stages of project preparation of buildings.			
124YDFS	Precast concrete structures	Z	2
Residential houses made of precast concrete panels, of which approx. 82 thousand were built in the period 1960-1995 do not meet the required extent of the current dynamically developing society and in many cases require the implementation of regeneration and modernization interventions enabling their full use. The course is focused on the current issues of renewal, reconstruction and modernization of precast houses, modernization of apartments in precast houses, on the issue of freeing parterres of precast houses for services, shops, offices, fitness centers, etc. Renovation, modernization, or regenerations require the removal of functionally inadequate completion structures, technical equipment, installations and, in some cases, even demanding interventions in supporting structures. As part of the construction of communication networks, modernization of urban development, etc., it is necessary in some cases to carry out partial or complete demolition of a precast panel building. As part of the regeneration of precast panel housing estates, an extension is also carried out, or completion of precast houses. The implementation of the mentioned plans requires a survey and diagnostics of supporting and peripheral structures, joints of parts and an evaluation of the structural-technical condition and an assessment of the residual life of precast panel structures and buildings.			
124YPR1	Failures, Deterioration, Renovations 1	ZK	3
As part of the course, students will learn about the mechanisms of degradation processes and failures of buildings according to the building materials used, structural statics and analytical issues of failures, rehabilitation and restoration of other load-bearing structures of historical buildings. The lectures, structured into thematic areas, will include in particular: familiarization with the principles and building codes applied in the construction solution of historical buildings and their parts, basic structural static and material issues of historical buildings, analysis of degradation processes, effects and influences of variables over time, which together with transportation processes affect the lifetime, durability and construction-technical condition of historical objects, methods and processes applied in the restoration and reconstruction of historical buildings, construction-technical condition of historical buildings and knowledge of diagnostic methods and procedures applied in the survey and monitoring of historical buildings.			
124YPRS	Failures, Deterioration, Renovations	Z	2
The course is focused on the current issue of restoration, reconstruction and modernization of buildings (residential, industrial, etc.), on historical structures and materials, the issue of degradation and aging of structures and materials of historical buildings, their residual life and failures of historical buildings and their parts. An integral part is the issue of structural-technical and historical surveys, diagnostics and assessment of the structural-technical condition and remaining service life.			
124YPS5	Prefabricated structures	Z	2
124YRHS	Reconstruction of Historical Building Structures	Z	2
In the period from the second half of the 19th century by 1960, more than 250 thousand of two- to five-story brick apartment (mainly rental) houses in traditional brick technology were constructed in the Czech Republic. Brick buildings from this period were built according to regulations, building codes and laws from the turn of the 19th and 20th centuries. Multi-storey brick tenement houses do not meet the current thermal, acoustic and other requirements, the requirements of a dynamically developing society to the required extent, and in many cases require regeneration and modernization interventions, including the replacement of non-compliant and out-of-date structures and equipment enabling their further use. The course is focused on the current issue of renewal, reconstruction and modernization of brick multi-storey rental apartment buildings, on historical structures and materials, the issue of degradation and aging of structures and materials of historic brick residential buildings, their residual life, failures and reconstruction of historical buildings and their parts. Furthermore, the course is focused on the issue of improving the well-being of the internal environment, the replacement of finishing structures, opening fillings, etc. as an integral part of the modernization of these buildings.			
125OZE1	Renewable Energy Sources	ZK	3
Renewable sources are becoming increasingly important sources of energy for buildings. Understanding their characteristics is key to the proper design and operation of these systems. The course therefore looks in detail at renewable sources and their applications.			
125YTCH	Technological Equipment of Buildings	Z	2
Sauna, fireplaces, kitchen technology, elevators, technology swimming pools, heat pumps, heat source and technological system, technology cooling, fire safety equipment, sprinklers.			
126YBVE	BIM in Public Investments	Z	2
126YPDV	Development Project	Z	2
129TYBC	Building Typology	Z	3
129YPVA	History of Architecture	ZK	3
132DKBU	Diagnostics of Structures and Buildings	KZ	3
132DPM	Diploma Thesis	Z	30
In accordance with the thesis proposal.			
132DYKC	Dynamics of Building Structures	Z,ZK	3
Principles of theory of vibration, dynamic loading. Free and forced vibration of single-degree-of-freedom systems. Damped vibration. Methods of dynamic analysis of multi-degree-of-freedom systems.			
132PRPM	Deformation and Failure of Materials	Z,ZK	5
Viscoelasticity, models for concrete creep. Theory of plasticity, principles of limit and incremental analysis. Fracture mechanics. Damage mechanics.			
132YKPA	Statics for Architecture	Z	2
132YMMO	Modern Methods of Optimization	Z	2
The course is aimed at an overview of numerical optimization methods applicable not only in the Civil Engineering area. The emphasis is put more on the introduction of driving principles, however, practical applications in MATLAB environment are also conducted during exercises.			
132YNA2	Numerical Analysis of Structures 2	Z,ZK	4
Advanced course on finite element method. Formulation of plate elements suitable for thin and thick plates, plates on elastic foundation. Introduction to nonlinear problems: geometrical and material nonlinearity, solution methods, implementation aspects.			

132YNAK	Nonlinear Analysis of Materials and Structures Students become acquainted with the concepts of linear stability and calculation of elastoplastic load capacity. Linear stability - evaluation of the critical load and buckling shape. Analysis of structures according to the 2nd order theory - equilibrium conditions on a deformed structure, initial stress matrix. Elastoplastic analysis of structures - evaluation of the limit load capacity, distribution of internal forces at the limit state - static incremental method, kinematic method. Solving stability and elastoplasticity problems by means of a general-purpose finite element program.	Z	2
132YPM2	Computer Analysis of Structures 2 Limit state of frames. Stability analysis of structures. Second order theory. Beams and gridwork girders on elastic foundation. Plate and wall structures. Dynamic analysis of structures. Verification of results.	Z	2
132YSEI	Seismic Engineering Basic principles of design of earthquake resistant structures. Methods of calculating the response of structures to earthquake loads according to Eurocode 8.	Z	2
132YSHK	Statics and Reconstruction of Historical Structures Short overview of historical vaults and roof trusses. Static behaviour and most frequent causes of failure. Methods of reconstruction, changes in foundation conditions included. Most frequent causes of failure of panel buildings. Visit to the historical part of Prague Castle.	Z	2
132YSSK	Reliability of Structures The course is devoted to the reliability of elements and systems. Element reliability is time dependent while the reliability of systems is of type strength-load. Complicated cases are solved by the FORM method. Two simulation methods are introduced: Monte Carlo and LHS.	Z	2
132YUPM	General Principles of Mechanics Tensors, differential operators and their application in mechanics, Gauss and Green theorems. General structure of the basic equations of linear and nonlinear statics, energy and duality. Principle of virtual work (power), variational principles (Lagrange, Castigliano, Hellinger-Reissner, Hu-Washizu) and their application to continuous and discrete models of beams, frames, plates, walls and three-dimensional bodies.	Z,ZK	4
133BOKO	Concrete and Masonry Structures 1	Z,ZK	4
133DPM	Diploma Thesis In accordance with a thesis proposal.	Z	30
133YATK	Applied Theory of Structures Detailed introduction to theoretical approaches to the effects of creep and shrinkage on structures. Principles of time-dependent analysis. Methods for the analysis of thin-walled concrete structures, stability theory.	Z,ZK	4
133YBEX	Concrete under Extreme Conditions The course is focused on concrete and concrete structures under extreme conditions.	Z	2
133YMBV	Concrete and Masonry Structures 1 The content of the subject will be selected problems from the following areas: Reinforcement of discontinuities of reinforced concrete structures. Introduction to nonlinear modeling of reinforced concrete structures. Preparation of input data for numerical models. Design of structures using MATLAB. Presentation of selected programs for the design of concrete structures.	Z	2
133YPNB	Fire design of concrete and masonry structures The course is focused on fire resistance of concrete and masonry structures: concrete and concrete structures exposed to fire, design rules, thermal analysis, loads, design principles, design methods, material properties of concrete and steel reinforcement at high temperatures, fire design of masonry structures.	Z	2
133YPRK	Failures and Rehabilitation of Concrete Structures The course focuses on the description of failures of concrete structures, explanation of the causes of these failures and the design of remedial measures. Methods of strengthening existing concrete structures are also discussed. Surface repairs, strengthening of contactors, strengthening of structural elements to the effects of bending moment and shear, and foundation structures are discussed. The course appropriately combines theoretical approaches with common practice.	Z	2
133YVHB	Ultrahigh Performance Concretes The aim of the course is to present a special type of concrete that achieves great strength and high durability, which enables the realization of very thin structures. The components of high performance concrete are presented and the main differences in composition of ordinary concrete and HPC. A large part of the lectures is devoted to the components of high performance concrete, the composition and the method of manufacturing, which are subsequently accompanied by laboratory exercises, where the students can experience the theoretical knowledge in practical use.	Z	2
134DPM	Diploma Thesis Design of steel / timber load bearing building structure according to external requirements in relation to interaction of load bearing and final completion structural elements. A study focused on research of load bearing structures may be also the topic of the the project. The project is assigned by a final project supervisor individually.	Z	30
134YDKM	Timber structures and bridges Timber structures focused to national strategy of sustainable development. New timber-based materials. Structural systems of houses and bridges. Repairing and strengthening. Fire design. Production, protection, erection and maintenance. Design and evaluation of bridges, roofs structures in normal temperature and in fire.	Z	2
134YHNK	Stainless steel and aluminium structures Subject YHNK covers two parts: the first concerns design of structures from aluminium alloys, the second deals with stainless steel structures. Structures of aluminium alloys: Introduction and practice in designing of aluminium structures. Structures of stainless steel: Evolution of stainless steel materials/structures and examples of realized structures. Stainless steels suitable for structures are described in a detail, including their properties. Dissimilarities in assessments of members under common loadings with respect to low-carbon steels is described for both ultimate and serviceability limit states. In the end the possibilities concerning connections of stainless steel members, erection and installation of stainless steel members are described.	Z	2
134YNDK	Load-bearing timber roof constructions System of roofs structures. Creation of numerical models for assessment of internal forces and deformations for main different roof systems and structures. Analysis of the static function and behaviour of main individual elements and their design. Historic structures and their reconstruction. Designing typical structural details based on carpentry joints. We will discuss also using modern methods of joining elements of timber structures.	Z	2
134YNSK	Design of Glass Structures The subject is intended for students of the master's program Civil Engineering, deepens the knowledge acquired in the subject 134YNSK. Extension of theoretical knowledge in the field of stability of glass beams, columns and walls. Principles of designing structural elements made of glass according to normative documents, experimental verification of material properties of glass, safety glass, use of software support for designing.	Z,ZK	2
134YPMK	Design of Membrane Structures	Z	2
134YPOD	Fire Resistance of Steel and Timber Structures The class gives introduction to fire modeling, fire safety and fire resistance of steel, steel-concrete composite and timber structural elements.	Z	2
134YROK	Extending the Life of Steel and Timber Structures Materials used for bearing structures. Developments in the area of regulations and standardization. Causes of defects, malfunctions, survey of objects, static assumptions of reconstruction. Possibilities of strengthening, strengthening of steel and timber structures and strengthening of connections. Using of computers in reconstructions and development of numerical models.	Z	2

134YSMK	Stability and modelling of steel structures Subject YSMK covers two parts. The first one deals with stability and strength of steel plates, the second one with stability and strengths of steel frame structures. In the first part the historic collapses of steel structures are analysed including the importance of imperfections for a design of thin plated structures. Presented are principles of theory of buckling, linear and nonlinear theory of buckling of thin plates. The results are applied to the 4th class cross sections in harmony with Eurocode. Buckling due to normal, shear and local loadings including their combination is analysed in a detail. In the end the application of the results is shown together with design of necessary stiffeners. The second part is focused on member and structure stability. Possible global analysis methods are presented together with methods for compression and bending interaction for slender members. In detail, specific cases of lateral torsional buckling are explained including also tapered members.	Z	2
134YSOD	Connections of steel and timber structures The subject allows insight and ability to apply the knowledge related to structural connections and its application by software.	Z	2
134YSOK	Special steel structures Crane supporting structures - actions, design, detailing. Silos - actions, behaviour, silos with rigid and non-rigid section. Masts - division, detailing, design. Cable roofs - procedure of calculation.	Z	2
135DPM	Diploma Thesis In the diploma thesis, the student deals with a topic chosen by the department from those regularly announced by the department. It addresses, for example, problems related to the design and construction of geotechnical structures, civil engineering structures, special foundations for industrial, transport, housing and water management structures, earth and rock structures in complex cases and waste disposal structures. The thesis builds on and develops the findings of the thesis project.	Z	30
135YGSM	Geotechnical Software for Numerical modelling Students get acquainted with the Finite Element Method, the currently dominant tool for numerical modeling in Geotechnics. Emphasis is placed on introducing the basic principles of the Finite Element Method and their subsequent application to selected problems of Geotechnical Engineering. The course summarises the types of finite elements used in geotechnical applications, material models suitable for the description of soil deformation, and selected specifics associated with numerical modeling in geotechnics. This knowledge is further applied in the modeling of foundation, embedded walls, and stability problems.	Z	2
135YVPZ	Computer analysis in underground structures Numerical methods in CAD/CAM in geomechanics. Basic types of constitutive models of soil and rock mass behavior. Summary of PC geotechnical software both in the field of conventional methods and in numerical modelling domain. Practical solutions of selected geotechnical problems.	Z	2
135ZS02	Foundations 2 The course deepens the knowledge from the previous course ZS1. It covers design principles, risks associated with the foundation of structures, deeper design of flat foundations, deeper design of deep foundations, negative casing friction of drilled piles, grouting (calculations and execution), construction pits, improvement of foundation soils.	Z,ZK	4
210YDSM	Diagnostics of Building Materials Properties Failures of building materials, mechanical, thermal, chemical and other influences on the development of failures of building materials. Diagnostics of their occurrence. Basics of experimental measurement and instrumentation of tested elements and structures. Theory of experiment, measurement and processing of results. Testing machines and equipment. Deformation measuring instruments. Destructive testing of mechanical properties. Non-destructive test methods. Test methodology for various materials (concrete, mortar, metallic elements, wood, glass, plastics, composites and others).	Z	2
210YSB	Special Concretes This course is aimed at expanding knowledge in the field of special concretes and composites for specific applications. The core of the course is to acquaint students with both the technological aspects of the production, testing and use of special concretes, as well as the applicable legislative framework for individual types of special concretes. Specific practical applications and experiences are also presented within the course.	Z	2
