## Recomended pass through the study plan

# Name of the pass: Specialization Signal processing - Passage through study

Faculty/Institute/Others: Faculty of Electrical Engineering

Department:

Pass through the study plan: Medical Electronics and Bioinformatics - Specialization Signal Processing

Branch of study guranteed by the department: Welcome page

Guarantor of the study branch:

Program of study: Medical Electronics and Bioinformatics

Type of study: Follow-up master full-time

Note on the pass:

Coding of roles of courses and groups of courses:

P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV - compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

#### Number of semester: 1

#### List of courses of this pass:

Code	Name of the course	Completion	Credits				
BDIP30	BDIP30 Diploma Thesis						
Independent final	Independent final comprehensive work for the Master's degree study programme. A student will choose a topic from a range of topics related to his or her branch of study, which will						
be specified b	be specified by branch department or branch departments. The diploma thesis will be defended in front of the board of examiners for the comprehensive final examination.						
BE0M37FAV	Physiology and modeling of hearing and vision	Z,ZK	6				

The primary aim of the course is to study the physiology of sensors and processes of perception of audio and visual information by human subjects as two central and most important communication channels, i.e., Human Auditory System (HAS) and Human Visual System (HVS). The course summarizes current knowledge in the field of human vision and hearing physiology and, at the same time, presents their description using mathematical models using the latest computational tools and procedures, including Machine Learning (ML), Deep Learning (DL) and Artificial Intelligence (AI). Emphasis is also placed on current and prospective applications of the mentioned knowledge. The main application area is the audiovisual technology related to human perception, but the direct employment of the acquired knowledge also includes the areas of multimedia technology, control systems, automation, robotics, safety and security technology, bioinspired systems, etc. At the same time, students gain a general overview of information processing in biological systems. A separate part is the objectification of audiovisual information perceived quality, i.e., Quality of Experience (QoE). The course is intended for students of master's degree in technical fields. The exercises will be devoted to fundamental experiments to determine the most important characteristics of HAS and HVS, including computational models and simulation of vision and hearing processes.

BE4M33PAL	Advanced Algorithms	Z,ZK	6
Basic	graph algorithms and graph representation. Combinatorial algorithms. Application of formal languages theory in computer science - pa	ttern matching.	'
E4M33SSU	Statistical Machine Learning	Z,ZK	6
he aim of statisti	ical machine learning is to develop systems (models and algorithms) for learning to solve tasks given a set of examples and some prior	r knowledge abo	out the tas
is includes typic	al tasks in speech and image recognition. The course has the following two main objectives 1. to present fundamental learning concep	ts such as risk r	ninimisatio
ximum likelihoo	d estimation and Bayesian learning including their theoretical aspects, 2. to consider important state-of-the-art models for classification	and regression	and to sh
	how they can be learned by those concepts.		_
BE4M35KO	Combinatorial Optimization	Z,ZK	6
e goal is to show	the problems and algorithms of combinatorial optimization (often called discrete optimization; there is a strong overlap with the term ope	erations researd	h). Follow
he courses on li	inear algebra, graph theory, and basics of optimization, we show optimization techniques based on graphs, integer linear programming	, heuristics, app	roximation
llgorithms and s	tate space search methods. We focus on application of optimization in stores, ground transportation, flight transportation, logistics, plan	nning of human	resources
	scheduling in production lines, message routing, scheduling in parallel computers.		
E4M36MBG	Molecular Biology and Genetics	Z,ZK	6
E4M36SAN	Statistical data analysis	Z,ZK	6
s course builds	on the skills developed in introductory statistics courses. It is practically oriented and gives an introduction to applied statistics. It mainly a	aims at multivari	ate statist
alysis and mode	elling, i.e., the methods that help to understand, interpret, visualize and model potentially high-dimensional data. It can be seen as a pure	rely statistical c	ounterpar
	machine learning and data mining courses.		
E4M36SMU	Symbolic Machine Learning	Z,ZK	6
his course con	sists of four parts. The first part of the course will explain methods through which an intelligent agent can learn by interacting with its er	vironment, also	known a
	arning. This will include deep reinforcement learning. The second part focuses on Bayesian networks, specifically methods for inferenc	-	
undamental topi	ics from natural language learning, starting from the basics and ending with state-of-the-art architectures such as transformer. Finally, t	he last part will	provide a
	introduction to several topics from the computational learning theory, including the online and batch learning settings.

Students obtain the basic knowledges in the field of electrical engineering.  Applications of Electromagnetic Fields in Medicine  elese lectures is to give to students a basic overview of biophysical aspects of EM fields in different biological systems, including an overviey limits, clinical usage of EM field effects on biological systems, microwave hyperthermia, measurement of dielectric parameters of biological phases in the processing of EM field effects on biological systems, microwave hyperthermia, measurement of electrical parameters of biological phases, in clinical applications. Next, it describes the algorithms for adaptive dec	cous mechanism se of modern na Ve will also disconsisted to elect ods (repetitive transcond half of the otherapy, etc.). BEAM31ZAS	Analog Signal Processing	Z,ZK	6
The course deals w	ith analog input-output blocks for signal transmission and processing. They discussed circuit solution of amplifiers and filters, including t	heir design process	s, simulation
and measuremen	t. Students learn the circuit concepts and possibilities for solving the contemporary analogue structures. The second part of the cour	se describes the d	esign and
implementa	ation of analog filters, including discrete-time circuits. The conclusion is devoted to the possibilities of computer optimization of electrons	onic circuits and filt	ers.
BEAM33MOS	Modeling and Simulation	Z,ZK	6
The modelling te	chniques being frequently used in biomedical engineering and corresponding software tools: Matlab-Simulink, Modelica. Techniques	of modelling and p	rocesses
associated with	hem. Types of models, continuous and discrete time models, linear and nonlinear models with lumped parameters, models and their	implementation in	program
environment. Forma	alization and model creation for a selected system, its identification, verification and interpretation. Equilibrium states (homeostasis)	and their inquiry by	simulation.
Models of open an	d feedback systems. Use of fuzzy-neuronal models in biomedicine. Models of separate systems and whole constellations being defir	ned in biomedical e	ngineering.
	Models of cellular and physiological control, population models. Application of models for artificial organs production.		
BEAM33NIN	Neuroinformatics	Z,ZK	6
The Neuroinformati	cs Course concentrates on modelling of neurons, stochastic learning on cellular level, information coding and decoding in brain and si	ngle unit processing	g. Examples
	from clinical practices are provided throughout the course. The labs focus on signal neuron analysis from human and animal b	rain.	
BEAM33ZMO	Medical Image Processing	Z,ZK	6
This subject describ	bes algorithms for digital image processing of 2D and 3D images, with emphasis on biomedical applications. We shall therefore conc	entrate on the mos	t often used
techniques in me	edical image processing: segmentation, registration, and classification. The methods will be illustrated by a range of examples on me	dical data. The stu	dents will
implement some of	the algorithms during the practice sessions. Because of the very large overlap between courses A6M33ZMO and A4M33ZMO, the	courses will be tauç	ght together
	this year.		
BEAM33ZSL	Medical Imaging Systems	Z,ZK	6
The course covers	he principles, design and properties of currently used medical imaging devices. We shall deal with 2D microscopic, X-ray and ultrasou	and imaging system	ns, including
advanced topics su	ch as Doppler ultrasound. We will also study tomographic (3D) imaging systems: computed tomography (CT), magnetic resonance ima	iging (MRI) includin	ng functional
	MRI (fMRI) and nuclear imaging methods (PET,SPECT). For more information see https://cw.fel.cvut.cz/wiki/courses/zsl		
BEAM36BIN	Bioinformatics	Z,ZK	6
BEAM38KLS	Construction of Medical Systems	Z,ZK	6
General principles	and design and construction of medical devices and systems. Technical standards and requirements for the design, construction and	operation of medic	cal electrical
appliances. Class	sification classes of instruments. Electromagnetic Compatibility of Medical Devices. Modern component base. Design and construction	on of basic blocks o	of medical
	devices.		
BEEZM	Safety in Electrical Engineering for a master's degree	Z	0
The course provi	des for students of all programs periodic training guidelines for health and occupational safety and gives knowledge of electrical haz	ard of given branch	of study.
	Students receive indispensable qualification according to the current Directive of the Dean.		
BEMPROJ6	Diploma Project	Z	6
Independent work	in the form of a project. A student will choose a topic from a range of topics related to his or her branch of study, which will be speci	fied by branch dep	artment or
	branch departments. The project will be defended within the framework of a subject.
