Recomended pass through the study plan

Name of the pass: Cybernetics and Robotics - Passage through study

Faculty/Institute/Others: Faculty of Electrical Engineering Department: Pass through the study plan: Cybernetics and Robotics Branch of study guranteed by the department: Welcome page Guarantor of the study branch: Program of study: Cybernetics and Robotics Type of study: Follow-up master full-time Note on the pass:

Coding of roles of courses and groups of courses:

P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV - compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

List of courses of this pass:

Code	Name of the course	Completion	Credits
BDIP30	Diploma Thesis	Z	30
Independent final	comprehensive work for the Master's degree study programme. A student will choose a topic from a range of topics related to his or h	ner branch of study	, which will
be specified b	y branch department or branch departments. The diploma thesis will be defended in front of the board of examiners for the compreh-	ensive final examin	nation.
BE2M32MKSA	MODILE NETWORKS	Z,ZK	6 robitocturo
and fundar	nental principles and functionalities of mobile networks with special locus on currently deployed technologies and future mobile networks (in nental principles of GSM_UMTS_UTE/LTE-A_ and 5G will be explained. Then, selected key technologies for future mobile networks (in	6G) will be explain	ed
BE3M33ARO1		7 7K	6
The Autonomous	robotics course will explain the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping and the principles needed to develop algorithms for intelligent mobile robots such as algorithms for intelligent mobile robots su	ping and localizatio	n (SLAM)
sensors calibration	(lidar or camera). (2) Planning the path in the existing map or planning the exploration in a partially unknown map and performing the p	plan in the world. IN	IPORTANT:
It is assumed that s	udents of this course have a working knowledge of optimization (Gauss-Newton method, Levenberg Marquardt method, full Newton m	ethod), mathemati	cal analysis
(gradient, Jacobia	n, Hessian), linear algebra (least-squares method), probability theory (multivariate gaussian probability), statistics (maximum likeliho	od and maximum a	aposteriori
estimate), python p	rogramming and machine learning algorithms. This course is also part of the inter-university programme prg.ai Minor. It pools the bes	st of AI education i	n Prague to
DEAMAGUIDA	provide students with a deeper and broader insight into the field of artificial intelligence. More information is available at https://prg.	ai/minor.	0
BE3M33HRU	HUMANOIG FODOIS	Z,ZK	0 ntroduces
humanoid robot teo	bology and its specific challenges and opportunities: (i) design kinematics and inverse kinematics of humanoids (ii) multimodal se	nsing - vision tour	ch hearing
inertial sensing, etc	., (iii) walking and balancing, and (ii) grasping. The second part of the course centers on human-robot interaction (HRI), which includes	s physical HRI (saf	ety aspects,
	collaborative robots) and cognitive/social HRI - how to design robots and behaviors to be acceptable for people.		
BE3M33MRS	Multi-robot aerial systems	Z,ZK	6
The course offers the	ne introduction to multirotor autonomous aerial systems (UAV). Standard senzors and principles of estimate and control of UAV will b	e introduced. The	problems of
motion	planning, path planning, localization, mapping and exploration will be discussed for sigle moving UAV as well as multiple UAVs movi	ng in a formation.	
BE3M33PKR	Advanced robot kinematics	Z,ZK	6
We will explain and	demonstrate techniques for modelling, analyzing and identifying robot kinematics. We will explain more advanced principles of the rep intigers suitable for identification of kinematic parameters from measured date. We will explain how to solve the inverse kinematic to	resentation of moti	ion in space
and the topol desci	puons suitable for identification of kinematic parameters from measured data, we will explain now to solve the inverse kinematic tas	ustrial robot	lanipulators
BE3M35DRS	Dynamics and Control of Networks	7 7K	6
This course res	bonds to an ever-increasing demand for understanding contemporary networks large-scale complex systems composed of many cor	mponents and sub	systems
interconnected into	a single distributed entity. Herein, we will consider fundamental similarities between diverse areas such as e.g. forecasting the sprea	d of global pander	nics, public
opinion dynamics a	nd manipulation of communities through social media, formation controls for unmanned vehicles, energy generation and distribution in p	ower grids, etc. Un	derstanding
such compelling i	ssues goes far beyond the boundaries of any single physical, technological or scientific domain. Therefore, we will analyze phenome	na across different	domains,
involving societal,	economic and biological networks. For such networked systems, the resulting behavior depends not only on the characteristics of the	er individual compo	first part of
the course introdu	ices fundamental theoretical and abstract computational network analysis concepts: in particular, the algebraic graph theory, network	k measures and m	etrics and
fundamental netwo	rk algorithms. The second part of the course subsequently views networks as dynamical systems, studies their properties and ways	in which these are	controlled,
	using mainly methods of automatic control theory.		
BE3M35HYS	Hybrid Systems	Z,ZK	6
Hybrid dynamical s	ystems, sometimes also referred to as cyber-physical systems, contain both subsystems governed by physical laws and subsystems	behaving according	ng to logical
rules and regula	tions, often encoded in the form of algorithms and implemented in software. The behaviour of the former can be described by real quarter to a software the behaviour of the letter is a software to be a software	antities whose evo	olution in
continuous or discre	are time is commonly modelled by differential or difference equations. The behaviour of the latter is commonly described by quantities (or even just two in the case of binary quantities), whose evolution is modelled by logical models such as finite state automata or Pe	taking on a counta	able of finite
analysis of hybrid s	vstems and the design of control systems for them, these two classes of models intersect. However, the control system itself can als	o be hybrid. And th	e industrial
reality is that pract	ical control systems contain, in addition to the continuous subsystems represented by PID controllers or Kalman filters, a subsystem	or component eva	luating the
satisfaction of log	ic conditions. Switched linear controllers (gain scheduling), supervisory control, sliding mode control or reset control are examples of	such controllers w	ith hybrid
dynamics. Hybrid c	ontrol methods are also becoming particularly important in a networked environment, where measurements or controls are sent over	r the network only	when some
condition is met, i	n order to minimize network traffic (event triggered control). Hybrid dynamical systems thus represent a suitable theoretical and extre	mely practical fran	nework for
modelling, analysis	and synthesis of a large number of practical control systems. The aim of this advanced course is to help students acquire basic com	petences (knowled	ige but also
BE3M35KOA	practical design/computational skills) in this practically very relevant and theoretically sum intensively developed area.	7 7K	6
The goal is to show	the problems and algorithms of combinatorial optimization (often called discrete optimization; there is a strong overlap with the term o	ے, <i>ک</i> رک perations research). Following
the courses on li	near algebra, graph theory, and basics of optimization, we show optimization techniques based on graphs, integer linear programmin	g, heuristics, appro	oximation
algorithms and st	ate space search methods. We focus on application of optimization in stores, ground transportation, flight transportation, logistics, pl	anning of human re	esources,
	scheduling in production lines, message routing, scheduling in parallel computers.		
BE3M35LSY1	Linear Systems	Z,ZK	6
The purpose of thi	s course is to introduce mathematical tools for the description, analysis, and partly also synthesis, of dynamical systems. The focus v	vill be on linear tim	e-invariant
controllers will be e	tput systems and their properties such as stability, controllability, observability and state realization. State reedback, state estimation relained in detail. Partially covered will be also time-varying and poplinear systems. Some of the tools introduced in this course are re-	, and the design of adily applicable to	stabilizing
problems such as	the analysis of controllability and observability in the design of flexible space structures, the design of state feedback in aircraft control	ol. and the estimati	ion of state
variables. The main	motivation, however, is to pave the way for the advanced courses of the study program. The prerequsites for this course include under	ergraduate level line	ear algebra,
	differential equations, and Laplace and z transforms.		
BE3M35NES	Nonlinear Systems	Z,ZK	6
The goal of this cou	rse is to introduce basics of the modern approaches to the theory and applications of nonlinear control. Fundamental difference when	dealing with nonline	ear systems
control compared v	vith linear case is that the state space approach prevails. Indeed, the frequency response approach is almost useless in nonlinear co	ntrol. State space	models are
equations will be pr	many unrerential equations, therefore, an introduction to solving these equations is part of the course. More importantly, the qualitative n esented, among them I vaninov stability theory is crucial. More specifically, the focus will be on I vaninov function method enabling t	neurious for ordinar	of nonlinear
systems, not only	that of linear ones. Furthemore, stabilization desing methods will be studied in detail, among them the so-called control Lyapunov fi	unction concept an	d related

backstepping method. Special stress will be, nevertheless, given by this course to introduce and study methods how to transform complex nonlinear models to simpler forms where more standard linear methods would be applicable. Such an approach is usually refered to as the so-called exact nonlinearity compensation. Contrary to the well-known approximate linearization this method does not ignore nonlinearities but compensates them up to the best possible extent. The course introduces some interesting case studies as well, e.g. the planar vertical take off and landing plane ("planar VTOL"), or a simple 2-dimensional model of the walking robot.

BE3M35OFD Estimation, Filtering and Detection	Z,ZK	6
This course will cover description of the uncertainty of hidden variables (parameters and state of a dynamic system) using the probability language	e and methods for their e	estimation.
Based on bayesian problem formulation principles of rational behavior under uncertainty will be analyzed and used to develop algorithms for par	ameter estimations (AR)	K models,
real life problems for the areas of industrial process control, robotics and avionics.	tion of the algorithms ap	plicable in
BE3M35ORR Optimal and Robust Control	Z,ZK	6
This advanced course will be focused on design methods for optimal and robust control. Major emphasis will be put on practical computational skil assignments.	Is and realistically compl	lex problem
BE3M35PSR Real-time Systems Programming	Z,ZK	6
The goal of this course is to provide students with basic knowledge about software development for real-time systems, for example in control and	embedded applications.	. The main
tocus is on embedded systems equipped with a real-time operating system (RIOS). Lectures will cover real-time systems theory, which can be used	to formally verify timing of	
During labs, students will first solve a few simple tasks to familiarize them with basic components of VxWorks RTOS and to benchmark the used (DS and hardware (Xilinx	Zvna). The
obtained metrics represent the typical criteria for assessing the suitability of a given platform for the given application. After the simple tasks, st	udents will solve comple:	x task of
time-critical motion control application which will require full utilization of RTOS features. All the tasks at the labs will be implemented	in C (or C++) language.	
BE3M35RSA Automotive Control Systems	Z,ZK	6
BE3M35SRL Flight Control Systems	Z,ZK	6
The course is devoted to classical and modern control design techniques for autopilots and flight control systems. Particular levels are discussed	, starting with the dampe	ers attitude
angle stabilizers, to guidance and navigation systems. Next to the design itself, important aspects of aircraft modelling, both as a rigid body and co are discussed	onsidering flexibility of the	e structure,
BE3M38ASE Automotive sensors and networks	Z,ZK	6
The course provides students with a deeper insight into the functional principles of advanced sensor systems in cars, methods of signal processing	in sensors and explains	how to use
them in vehicle subsystems. It also deals with distributed vehicle systems for real-time control and methods of their testing. Theoretical lectures are control and methods of their testing. Theoretical lectures are control and methods of their testing.	omplemented by practica	I laboratory
BE3M38DIT1 Diagnostics and Testing	7.7K	6
The course aims to introduce students to the problems of modelling and fault detection ensuring fault tolerance monitoring the operational status	s of complex industrial cc	omponents
and autonomous systems, non-destructive testing and diagnostics of electronic devices with analogue and digital cir	rcuits.	mpononio
BE3M38INA1 Integrated avionics	Z,ZK	6
The course Integrated Modular Avionics (IMA) focuses on a modern concept of the approach to the development and design of aircraft electronics	(avionics), where the trai	nsition from
distributed HW systems to SW blocks. They use high-speed connections to exchange data in applications related to paid air transport. The exist	ing regulatory basis and	airspace
sharing define the requirements for the accuracy, reliability, and functionality of electronic systems even in the event of a failure. In the course, st	udents will learn details a	about the
requirements for so-called safety-critical multi-sensor systems, methods of data processing from predetermined systems, fault detection methods	, selection of primary cor	nputer and
	.s. 77K	6
Overview of sensors of physical quantities used in industry and research and associated methods of signal processing. Students will gain advanced	knowledge of sensors a	nd methods
of signal processing. They will gain practical experience with measurement of physical quantities with various types of	sensors.	
BE3M38PSL1 Aircraft Avionics	Z,ZK	6
The course acquaints students with the current technology used in aircraft instruments and unmanned aerial vehicles, ie systems and sensors wor	king in the low frequency	/ range and
methods used to process their data. The course includes a detailed description of aircraft instrumentation and its resistance to external influences, a description of aircraft instrumentation and its resistance to external influences.	lescription of aircraft pow	er sources,
analysis of instruments and systems for measuring engine and aerometric quantities, and a description of emergency and operational diagnostics.	on equations including r	nethods of
fusion of navigation data and their processing.	on oquationo, moraaling i	
BE3M38SPD1 Data acquisition and transfer	Z,ZK	6
The aim of the course is to acquaint students with the principles and limits of data transmission from sensors and similar sources of information	for IoT and M2M commu	unication,
wireless sensor networks, and specific algorithms used in them, respecting the limiting conditions of their function. The basic algorithms of distribut	ed information processin	ig in sensor
networks will be studied, as well as technologies for obtaining energy for powering wireless nodes of the networ	<u>k.</u>	
BE3M38VBM1 Videometry and Contactless Measurement	Z,ZK	6
I ne course deals with optoelectronic sensors and their use in non-contact measurement systems based on the principles of videometry; problems of i behavior: ontical projection system. The course deals with the lab tasks, it is further solved, practically realized and presented the evaluated p	radiation and waves, their	properties,
BE3M38VIN1 Virtual Instrumentation		6
The subject deals with modern measuring instruments, virtual instruments (VI) and data acquisition and processing systems (DAQ). It presents princip	les of instruments and m	easurement
systems in laboratory and industrial environment, selected measurement methods and standards for programming of VI and	DAQ systems.	
BE3M38ZDS1 Signal processing and digitization	Z,ZK	6
Students will gain knowledge for the design and implementation of systems for processing and digitization of analog signals. They will deepen the	e knowledge acquired in	previous
theoretical subject and gain practical experience in the design and analysis of systems for signal processing, AD conversion and data acquisitation	n. Emphasis is placed or	n reducing
uncertainties, speed, stability and resistence to interfering signals.		
BE3MPROJ6 Project	Z	6
DEDIVIEVITING THE DEDIVIEVITING THE Activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people perform in companies and their personal lives. In this course, students can try how to sufficient the determined of the activities that people performs in companies and their personal lives.	olve a technical task in a	team how
to cooperate, how to communicate together and how to solve problems such as project delays, how to include external influence	in the plan, etc.	
BE4M33MPV Computer Vision Methods	Z,ZK	6
The course covers selected computer vision problems: search for correspondences between images via interest point detection, description and n	natching, image stitching	, detection,
recognition and segmentation of objects in images and videos, image retrieval from large databases and tracking of objects in video sequence	s. This course is also par	rt of the
inter-university programme prg.ai Minor. It pools the best of AI education in Prague to provide students with a deeper and broader insight into the information is available at https://prg.ai/minor.	field of artificial intellige	nce. More
BE4M33SSU Statistical Machine Learning	Z.ZK	6
The aim of statistical machine learning is to develop systems (models and algorithms) for learning to solve tasks given a set of examples and sor	ne prior knowledge abou	it the task.
This includes typical tasks in speech and image recognition. The course has the following two main objectives 1. to present fundamental learning	concepts such as risk mi	nimisation,

maximum likelihood estimation and Bayesian learning including their theoretical aspects, 2. to consider important state-of-the-art models for classification and regression and to show how they can be learned by those concepts

	now they can be learned by those concepts.				
BE4M33TDV	Three-dimensional Computer Vision	Z,ZK	6		
This course introduces methods and algorithms for 3D geometric scene reconstruction from images. The student will understand these methods and their essence well enough to be					
able to build varian	ts of simple systems for reconstruction of 3D objects from a set of images or video, for inserting virtual objects to video-signal source	, or for computing	ego-motion		
trajectory from a s	equence of images. The labs will be hands-on, the student will be gradually building a small functional 3D scene reconstruction syste	em and using it to	compute a		
	virtual 3D model of an object of his/her choice.				
BE4M36UIR	Artificial Intelligence in Robotics	Z,ZK	6		
The course aims to	acquaint students with the use of planning approaches and decision-making techniques of artificial intelligence for solving problems	arising in autonom	nous robotic		
systems. Students	n the course are employing knowledge of planning algorithms, game theory, and solving optimization problems in selected application	n scenarios of mob	ile robotics.		
Students first learn	architectures of autonomous systems based on reactive and behavioral models of autonomous systems. The considered application s	cenarios and robot	tic problems		
include path planni	ng, persistent environmental monitoring, robotic exploration of unknown environments, online real-time decision-making, deconflictior	n in autonomous sy	ystems, and		
solutions of antag	onistic conflicts. In laboratory exercises, students practice their problem formulations of robotic challenges and practical solutions in a	a realistic robotic si	imulator or		
consumer mobile	probots. This course is also part of the inter-university programme prg.ai Minor. It pools the best of AI education in Prague to provide	students with a de	eper and		
	broader insight into the field of artificial intelligence. More information is available at https://prg.ai/minor.				
BEEZM	Safety in Electrical Engineering for a master's degree	Z	0		
The course provides for students of all programs periodic training guidelines for health and occupational safety and gives knowledge of electrical hazard of given branch of study.					
Students receive indispensable qualification according to the current Directive of the Dean					

For updated information see <u>http://bilakniha.cvut.cz/en/f3.html</u> Generated: day 2025-07-02, time 03:42.
