Recomended pass through the study plan

Name of the pass: Doctoral study, structured combined study

Faculty/Institute/Others: Department: Pass through the study plan: Doctoral studies, structured combined studies Branch of study guranteed by the department: Welcome page Guarantor of the study branch: Program of study: Welcome page Type of study: unknown combined Note on the pass: ~Každý student si volí rozložení p edm t do semestr individuáln.

Coding of roles of courses and groups of courses: P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

Number of semes	ster: 1					
Code	Name of the course / Name of the group of courses (in case of groups of courses the list of codes of their members) Tutors, authors and guarantors (gar.)	Completion	Credits	Scope	Semester	Role
ХРККРРР	Doktorské p edm ty XPkkppp XP02AMA,XP37AEM, (see the list of groups below)	Min. cours. 0	Min/Max 30/50			S

List of groups of courses of this pass with the complete content of members of individual groups

List of courses of this pass:

Code	Name of the course	Completion	Credits		
XEP17SWR	Scientific Writing	ZK	4		
This course is inter	This course is intended to help researchers organize and effectively communicate, in English, their scientific results. While the instructor is an Electrical Engineer, the approaches				
	applicable to all technical disciplines.				

XEP33NEP	Fuzzy Logic	ZK	4
AEFOONEF 1	Basics of fuzzy sets and fuzzy logic. Measures on collections of fuzzy sets. Principles of fuzzy control. Neuroprosthetics	Z,ZK	4
Neuroprosthetics i	concerned with the use of artificial devices to replace or improve the function of the human nervous system. The neuroprosthetic de		· ·
-	ant with approximately 150,000 in use worldwide. In this course we will look at the different technologies involved, particularly in term		-
materials and their	practical use. We will also see how such implants interact with the human nervous system, forming a bidirectional gateway both to m	onitor signals on	the nervous
system and to direct	tly stimulate the human brain. As well as witnessing the exciting development of the field we will consider neuroprosthetics in terms of	of practical restora	ative use, no
-	plants but also for visual and motor repair. We will however also look at the possibilities of Neuroprosthetics for general human enhan		-
	self experimentation fits into teh field. Whilst the course will focus on technical issues, it will be presented in a general way such that		
·	ematical background is not a requirement). Indeed as this technology has immediate impact, societal, ethical and moral issues raised		
course is compleme	ntary to the lecture course given on Bionics: this set of lectures being specifically concerned with neural aspects - linking the human l	orain and nervous	s system wit
	technology.	7 71/	4
XEP33NUM	Numerical Analysis	Z,ZK	4
	ces to basic numerical methods of interpolation and approximation of functions, numerical differentiations and integration, solution o ial equations and systems of linear equations. Emphasis is put on estimation of errors, practical skills with the methods and demonst		
nu partial) uneren	Maple and computer graphics.		per lies using
XEP33SAM	Understanding State of the Art Methods, Algorithms, and Implementations	ZK	4
	PhD students will study selected sophisticated state of the art methods that have an efficient implementation publically available. The		
	been successfully used in a number of applications. The goal for the students is to understand the method, to understand the implementation		0
	on as a tool to solve other problems. The course will include two strands. The first strand will be similar to a reading group - the stude		
-	rial, typically a published paper. In the second, practical component of the course, the students will use an implementation of the disc		
	particular task.		
XEP33SML	Structured Model Learning	ZK	4
	chine learning course covers learning and parameter estimation for structured models like Markov Random Fields, Belief Networks a	and (stochastic) D	eep Neural
	Networks.		
XEP33VKR	Selected Topics in Pattern Recognition and Computer Vision	ZK	4
	vith fundamental results from computer vision and pattern recognition. The course treats selected key results, as well as latest areas	of research, espe	ecially those
which substantiall	r influence the development in the subject field. Education is performed in the form of a reading group. The course is mainly targeting	PhD candidates	, but is also
	available for Msc students with strong interest, possibly experience too, on a research topic that is relevant to the course.		
XEP35CMS	Computational Methods for Materials Science	Z,ZK	4
he final goal of the	course is to acquire advanced knowledge of Classical and Quantum Mechanics to design in-silico experiments within the Materials	Science field. At th	he end of th
course, the stur	lents will know: - the fundaments of thermodynamics, newtonian and statistical mechanics, and how the relative formalism is implem	ented in order to	calculate
thermodynamical	roperties; - how the Schrödinger equation is setup and solved in order to calculate physical quantities; - how to combine the classica	al and quantum m	echanics to
nodel experimenta	results; and - a general protocol through which to design new materials at the atomic scale. By means of simulation laboratory experien	ce, the students w	vill eventually
	learn how to setup and run simulations, and how to analyse and present the results by using post-processing softwares.	·	
XEP36AGT	Advanced Computational Game Theory	ZK	4
XP01FA1	Functional Analysis 1	ZK	4
	Measure theory and Lebesgue integral. An introduction to Hilbert spaces. Theory of linear operators in Hilbert spaces. Spectral t	heory.	
XP01ITZ	Integral Transforms and Z Transform	ZK	4
	egral transforms, linearity. Laplace transform, inversion, limit theorems. Fourier transform. Application to solving integral and differenti		
distribution theory, F	ourier and Laplace transforms of distributions. Linear dynamic systems, causality, passivity, convolution. Systems with bounded spectru	um. Z-transform a	nd difference
	equations.		1
XP01KAS	Complexity and Combinatorical Algorithms	ZK	4
	nplexity of algorithms. P and NP problems and their solutions: exact solutions, heuristics, approximation schemes, probabilistic algorith		1
XP01KVP	Quantum Computing	ZK	4
Juantum computin	represents a new programming paradigm. The safety of nowadays encypering techniques is based on enormous computation compl	-	
	fety may be broken by quantum computers. The ``building stones" of a quantum computer and quantum computers will be develope	d during the cours	se. We will
problems. This sa	design fast factorization algorithms, fast database search, etc.		1 .

XP35CCM	Cooperative Control of Multi-agent systems	ZK	4
Cooperative distri	buted control is a relatively novel and rapidly developing area of control theory and engineering. Instead of centralized, large systems	are considered co	mposed of
autonomous subs	ystems, with local computation and communication capabilities. The broad aim is solving classical problems e.g. stabilization, tracking	, estimation and or	ptimization,
via local communic	ation and team cooperation robust to changes in communication topology and disturbance. Relevant topics of classical control theory	are revisited and a	brief review
of background ma	thematics needed for the course is also provided. The potential use of multi-agent cooperation in challenging applications involving e	nvironment to be co	ontrolled or
observed is discus	ssed. Theory: Review of qualitative properties of dynamical systems, Motivation for distributed multi-agent systems, Elements of algel	oraic graph theory,	Distributed
estimation and cor	trol, Consensus and synchronization of linear/nonlinear, continuous/discrete-time systems, Cooperative stability, optimality and robus	ness, Distributed o	ptimization:
	multi-player game theory, Interactions with environment.

	rement of extremely low voltage and current signals, lock-in amplifiers, power analyzers and electronic loads, devices used for EMC mea and optical reflectometers and radio testers (Bluetooth, NMT, GSM, UMTS). A special part is devoted to sampling measurement methor		-

XP38VKZ	Selected Chapters of Signal Processing	ZK	4	
The course is de	dicated to advanced signals processing methods used in contemporary electronic devices and measuring instruments. It concerns e.	g. the other types	of integral	
transformation (e	xcept Fourier), stochastic methods, processing of the multimedia signal, suppressing of unwanted effect, methods used for quality inc	creasing of multime	edia signal	
	transmission, etc.			
XP39PMV	Advanced Methods of Visualization	ZK	4	
Scientific visua	lization based on physical models. Scientific visualization and volume rendering. Volume graphics. Information visualization. Interactic	on in scientific visu	alization	
env	vironment. Scientific visualization in WWW environment. Particle models and visualization of technological processes. Computational	fluid dynamics.		
XP39SPG	Computer Graphics Seminar	Z,ZK	4	
The computer grap	The computer graphics seminar will cover selected research topics in computer graphics such as efficient rendering techniques, modeling of surface materials and their optical properties,			
simulation of natural phenomena, geometrical modeling and animation. In the seminar we will also discuss computer graphics techniques used in related research disciplines such as				
image processing	, computer vision and human computer interaction based on the particular topics of PhD theses of the participating students. The goa	al of the course is t	o introduce	
the selected topics to the students and by analyzing selected highly influential research publications to further develop the research capabilities of the students.				
XP39VPG	Computational Geometry	ZK	4	
Principles of computational geometry (CG), data structures and paradigms, methods of geometric search, convex polygons and hulls, applications of convex hull, proximity problems,				
Voronoi diagrams, triangulation, efficient intersection algorithms, intersection of semispaces and polygonal regions, geometry of rectangles, dual mappings and spaces, convex hull in				
dual space, algorithms of computer graphics and CG. Students who completed course 36VGE cannot enroll.				
XP39VR	Virtual reality	ZK	4	
Advanced methods in the VRML language. Standard and non-standard extensions to the VRML language. Programming of external applications with EAI interface. Multi-user virtual				
reality. Distant cooperation in virtual environment. Hardware and software support for virtual reality systems. QuickTime VR. Specification X3D.
