## Recomended pass through the study plan

## Name of the pass: Branch Systems and Control - Passage through study

Faculty/Institute/Others: Faculty of Electrical Engineering Department: Pass through the study plan: Cybernetics and Robotics - Systems and Control Branch of study guranteed by the department: Welcome page Guarantor of the study branch: Program of study: Cybernetics and Robotics Type of study: Follow-up master full-time Note on the pass:

Coding of roles of courses and groups of courses:

P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV - compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

Number of seme	ester: 1

## List of courses of this pass:

Code	Name of the course	Completion	Credits
B3M33ARO	Autonomous Robotics	Z,ZK	7
The Autonomous	, robotics course will explain the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapp	, bing and localization	n (SLAM)
sensors calibration	(lidar or camera). (2) Planning the path in the existing map or planning the exploration in a partially unknown map and performing the p	plan in the world. IN	/PORTANT:
It is assumed that s	tudents of this course have a working knowledge of optimization (Gauss-Newton method, Levenberg Marquardt method, full Newton m	nethod), mathemat	ical analysis
(gradient, Jacobia	an, Hessian), linear algebra (least-squares method), probability theory (multivariate gaussian probability), statistics (maximum likeliho	od and maximum	aposteriori
	estimate), python programming and machine learning algorithms.		
B3M33MKR	Mobile and Collective Robotics	Z,ZK	6
The course introd	uces a basic mobile robot structure design together with control methods aimed to achieve autonomous and collective behaviors for l	obots. Methods ar	nd tool s for
data acquisition	and processing are presented herein with the overall goal to resolve the task of autonomous navigation for mobile robots comprising	the tasks of sense	or fusion,
	leling including Simultaneous Localization And Mapping (SLAM) approaches. Besides sensor-processing related tasks, methods for r		
introduced. The ce	ntral topic of the course stands in specific usage of the afore methods capable of execution with groups of robots and taking the adva	ntage of their coop	peration and
coordination in grou	ups. Labs and seminars are organized in a form of an Open Laboratory whereas the students will implement some fundamental algorit	hms and study the	ir properties
	on real data.		
B3M33PIS	Industrial Information Systems	Z,ZK	6
The aim of this cou	, rse is to provide students with the necessary set of skills essential for the design and management of modern production systems. In	the first part of the	course, the
students will learn	about methods of modeling and simulation of discrete production systems. Students will then gain insight into methods for data analy	sis to optimize the	production
as well as into me	ethods for process mining. The final part of the course deals with methods of data and knowledge modeling, which are necessary for	explicit capture an	d machine
	utilization of information and knowledge about production.		
B3M33PRO	Advanced robotics	Z,ZK	6
We will explain and	demonstrate techniques for modelling, analyzing and identifying robot kinematics. We will explain more advanced principles of the rep	presentation of mot	ion in space
and the robot desc	riptions suitable for identification of kinematic parameters from measured data. We will explain how to solve the inverse kinematic tas	k of 6DOF serial m	nanipulators
a	ind how it can be used to identify its kinematic parameters. Theory will be demonstrated on simulated tasks and verified on a real ind	ustrial robot.	-

B3M33UI	Artificial Intelligence	Z,ZK	6
	ns and enriches knowledge of AI gained in the bachelor course Cybernetics and Artificial Intelligence. Students will get an overview of		
-	a experience with some of them. They will master other required abilities to build intelligent agents. By applying new models, they will r techniques to evaluate models, and methods for overfitting prevention. They will learn about planning and scheduling tasks, and abou	-	-
-	get ackquainted with the basics of probabilistic graphical models, Bayesian networks and Markov models, and will learn their applica		
	introduce students to the area of again populat neural networks, with an emphasis to new methods for deep learning.		
B3M35DRS	Dynamics and Control Networks	Z,ZK	6
This course res	sponds to an ever-increasing demand for understanding contemporary networks large-scale complex systems composed of many cor	nponents and sub	systems
	o a single distributed entity. Herein, we will consider fundamental similarities between diverse areas such as e.g. forecasting the sprea	<b>e</b> .	
	and manipulation of communities through social media, formation controls for unmanned vehicles, energy generation and distribution in p	-	-
	issues goes far beyond the boundaries of any single physical, technological or scientific domain. Therefore, we will analyze phenome economic and biological networks. For such networked systems, the resulting behavior depends not only on the characteristics of the		
-	sical or logical interactions, but also on a precise way those components are interconnected the detailed interconnection topology. For		
	luces fundamental theoretical and abstract computational network analysis concepts; in particular, the algebraic graph theory, network		
fundamental netw	ork algorithms. The second part of the course subsequently views networks as dynamical systems, studies their properties and ways	in which these are	controlled,
	using mainly methods of automatic control theory.		
B3M35LSY	Linear Systems	Z,ZK	8
	is course is to introduce mathematical tools for the description, analysis, and partly also synthesis, of dynamical systems. The focus		
	utput systems and their properties such as stability, controllability, observability and state realization. State feedback, state estimation	-	-
	explained in detail. Partially covered will be also time-varying and nonlinear systems. Some of the tools introduced in this course are re- the analysis of controllability and observability in the design of flexible space structures, the design of state feedback in aircraft contro		
	n motivation, however, is to pave the way for the advanced courses of the study program. The prerequisites for this course include under		
	differential equations, and Laplace and z transforms.	ingraduate teret inte	our argoora,
B3M35NES	Nonlinear Systems and Chaos	Z,ZK	6
	urse is to introduce basics of the modern approaches to the theory and applications of nonlinear control. Fundamental difference when		
-	with linear case is that the state space approach prevails. Indeed, the frequency response approach is almost useless in nonlinear co	-	-
based mainly on or	dinary differential equations, therefore, an introduction to solving these equations is part of the course. More importantly, the qualitative n	nethods for ordinary	y differential
	resented, among them Lyapunov stability theory is crucial. More specifically, the focus will be on Lyapunov function method enabling t		
-	ly that of linear ones. Furthemore, stabilization desing methods will be studied in detail, among them the so-called control Lyapunov fi	-	
	thod. Special stress will be, nevertheless, given by this course to introduce and study methods how to transform complex nonlinear m ear methods would be applicable. Such an approach is usually refered to as the so-called exact nonlinearity compensation. Contrary t	-	
	method does not ignore nonlinearities but compensates them up to the best possible extent. The course introduces some interesting		
	planar vertical take off and landing plane ("planar VTOL"), or a simple 2-dimensional model of the walking robot.		, orgr and
B3M35OFD	Estimation, filtering and detection	Z,ZK	6
	by by the second state of a dynamic system) using the probability language and state of a dynamic system) using the probability language and	· · · ·	
Based on bayesi	an problem formulation principles of rational behavior under uncertainty will be analyzed and used to develop algorithms for parameter	er estimations (AR)	X models,
Gaussian proces	s regression), filtering (Kalman filter) and detection (likelihood ratio theory). We will demonstrate numerically robust implementation o	f the algorithms ap	plicable in
	real life problems for the areas of industrial process control, robotics and avionics.		-

B3M38PSL	Aircraft Avionics	Z,ZK	6				
The subject is focu	sed into a field of aircraft avionics including principles, sensors, measurement and evaluation systems and signal/data processing m	ethods. The subje	ct goes into				
details of studied	systems, i.e. engine and aircraft monitoring systems, power systems, pressure-based systems, low-frequency navigation means, and	l flight recorders. T	he subject				
introduces current	y used technology and methodology on aircraft and thus serves to understand fundamentals of avionics. Inertial navigation systems	are discussed in n	nore details				
	as well as their aiding systems and sensors. The course focuses on both small and large aircraft as well as on UAV suited avio	nics.					
B3M38SPD	Data Acquisition and Transfer	Z,ZK	6				
The aim of the cour	e aim of the course is to acquaint students with principles and limits of data transmission from sensors and similar sources of information for IoT and M2M, wireless sensor network						
and specific algorithms, respecting the limiting conditions of their function. The basic algorithms of distributed information processing in sensor networks, as well as technology for							
energy harvesting for powering the wireless nodes of the network, will be studied.							
B3M38VBM	Videometry and Contactless Measurement	Z,ZK	6				
This course focuses on CCD and CMOS video sensors, and optoelectronic sensors in general and their use in contactless videometric measurement systems. Further optical radiation							
its features, behavior and its use for acquiring object parameters, optical projection system, design of measurement cameras and processing of their signal will be presented. Students							
will design, realize and debug an independent project - 'Optoelectronic reflective sensor', during labs.							
B3M38VIN	Virtual Instrumentation	Z,ZK	6				
B3M38ZDS	Analog Signal Processing and Digitalization	Z,ZK	6				
B3MPROJ8	Project	Z	8				
B3MPVT		KZ	6				
Teamwork is the ba	asis of most of the activities that people perform in companies and their personal lives. In this course, students can try how to solve a	technical task in a	a team, how				
t	o cooperate, how to communicate together and how to solve problems such as project delays, how to include external influences in the	ne plan, etc.					
BDIP30	Diploma Thesis	Z	30				
Independent final	comprehensive work for the Master's degree study programme. A student will choose a topic from a range of topics related to his or h	ner branch of study	, which will				
be specified b	by branch department or branch departments. The diploma thesis will be defended in front of the board of examiners for the compreh-	ensive final exami	nation.				
BEZM	Safety in Electrical Engineering for a master's degree	Z	0				
The course prov	des for students of all programs periodic training guidelines for health and occupational safety and gives knowledge of electrical haza	ard of given branch	n of study.				
	Students receive indispensable qualification according to the current Directive of the Dean.
