

# Study plan

## Name of study plan: 14 141 NSTI AME 2012 základ

Faculty/Institute/Others:

Department:

Branch of study guaranteed by the department: Welcome page

Garantor of the study branch:

Program of study: Mechanical Engineering

Type of study: Follow-up master

Required credits: 132

Elective courses credits: -8

Sum of credits in the plan: 124

Note on the plan:

Name of the block: Compulsory courses in the program

Minimal number of credits of the block: 91

The role of the block: P

Code of the group: 12NS\*1P-AME

Name of the group: 2012 NSTI 1.sem povinné AME

Requirement credits in the group: In this group you have to gain 26 credits

Requirement courses in the group: In this group you have to complete 7 courses

Credits in the group: 26

Note on the group:

| Code    | Name of the course / Name of the group of courses<br>(in case of groups of courses the list of codes of their members)<br>Tutors, authors and guarantors (gar.)                        | Completion | Credits | Scope | Semester | Role |

### Characteristics of the courses of this group of Study Plan: Code=12NS\*1P-AME Name=2012 NSTI 1.sem povinné AME

|         |                                  |      |   |   |
|---------|----------------------------------|------|---|---|
| 2121027 | Aerodynamics                     | ZK   | 3 | The subject is oriented on study of flowing fluids behavior with applications in technical praxis with emphasizes on flow of air. Lectures are focused on flow stability, turbulence, flow around bodies and interaction of flow with surfaces.   |
| 2013054 | Mathematics for Mechanics        | Z    | 4 | Summary: Tensor calculus. Introduction to functional analysis. Calculus of variations. • Orthogonal transformation of coordinate systems. • Affine orthogonal tensors and tensor operations. • Tensor as linear operator and bilinear form. • Metrics and metric spaces. Convergence. Completeness. • Linear normed space. Banach space. • Linear space with scalar product (unitary space). Hilbert space. • Contractive operators and Banach fixed point theorem. • Function spaces in examples. • Operators and functionals. Linear, continuous and bounded operator/functional. • Derivative of a functional in the given direction. Gateaux differential and derivative. • Necessary and sufficient conditions for extremes of a functional. • Convex set and convex functional. Minimum of convex functional. • Extremes of functional of different types. Euler equation. Necessary and sufficient conditions for extrema. • Discrete methods for approximation of the minima of an functional. Ritz method. |
| 2311075 | Mechanics of Mechanisms          | ZK   | 4 |   |
| 2141093 | Microelectronics                 | Z,ZK | 3 | Basic characteristics of logic circuits and programmable logical systems, input and output circuits - voltage and current matching, D/A and A/D converters, coding, lines and protocols of communications, electronic and optoelectronic parts for microelectronics, microprocessor system applications.  |
| 2312017 | Controlled mechanical systems I. | KZ   | 3 |   |
| 2121016 | Theoretical Fluid Mechanics      | ZK   | 4 | The study subject aim is to expand the students' knowledge gained from the previous subject Thermomechanics Alfa. The attention is focussed namely on fluids characteristics, various description methods of fluid dynamics under low and high Re number values, boundary layer characteristics and its stability and complex flow characteristics for incompressible flow.   |

**Characteristics of the courses of this group of Study Plan: Code=12NS\*2P-AME Name=2012 NSTI 2.sem povinné AME**

|         |  |    |   |   |  |  |
|---------|--|----|---|---|--|--|
| 2142027 | Electrical Engineering for Applied Mechanics | KZ | 3 | The purpose of the course is to give the student knowledge about different types of electrical drives for mechatronic systems and their practical use. Method for electromagnetic field approximative solution. The theory of linear and rotating drivers. Electromagnets supplied by AC and DC power. Static and dynamics parameters of electromagnets. Drives for rotating motion. DC motors. Mathematical description of their static and dynamic properties. Principle and function of stepper motor. AC induction motors. Mathematical description of their static and dynamic properties. Using MATLAB for drivers behaviour modelling.   |  |  |
| 2311074 | Vibrations of Mechanical Systems             | ZK | 4 |   |  |  |
| 2123018 | Heat and Mass Transfer                       | Z  | 2 | The course extends the knowledge gained in the subject Thermomechanics Alfa especially in the area of heat transfer. Attention is paid to more complex cases (non-stationary, multidimensional problems) as well as to processes where heat transfer is accompanied by simultaneous mass transfer (mixing exchangers).  |  |  |
| 2311076 | Simulation of Mechatronic Systems            | ZK | 3 |   |  |  |
| 2111049 | Theory of elasticity                         | ZK | 4 | The objective of this course is an introduction to the theory and applications of linear elasticity. It also provides the foundation for pursuing other solid mechanics courses such as theory of plasticity, fracture mechanics, composite structures, theory of plates and shells or continuum mechanics. This course introduces the basic definitions of stress and strain tensors used in the linear theory of elasticity, determines the principal stress and strain, derives equilibrium equations, compatibility conditions for strain tensor, postulates the constitutive relations for linear elastic material (generalized Hooke's law). The governing differential equations of elasticity are derived including the Navier's equation expressed in terms of the displacement vector and the Beltrami-Michell's equation expressed in terms of the stress tensor. Next, two-dimensional problems in cartesian and cylindrical coordinate systems is considered and the Airy stress function is introduced for the solution of these problems. A few useful applications are studied such as bending of a beam using the Airy stress function in the form of a polynomial, the stress distribution in a plate with small circular hole submitted to a uniform tension, the stress distribution for a concentrated vertical force action on a horizontal straight boundary, the stress distribution in a wedge due to a concentrated force at its apex. Finally, a brief introduction to the energy principles in solid mechanics is presented including the principles of virtual displacements and virtual forces. |  |  |
| 2121055 | Thermodynamics                               | ZK | 4 | The aim of the course is to expand the students' knowledge gained from the previous course Thermomechanics Alfa in the areas of the real gas thermodynamics, irreversible process thermodynamics, multiphase- and multicomponent system characteristics and thermodynamics cycles of the real heat engines and machines also.   |  |  |

| 2121043  | Computational Fluid Mechanics | ZK | 4 |
| This course extends the knowledge gained in the course of Fluid Mechanics about the knowledge of computational fluid dynamics. Emphasis is placed on understanding the basic principles of computational fluid dynamics based on using commercial codes. Selected problems of internal and external aerodynamics are solved. |                               |    |   |

Characteristics of the courses of this group of Study Plan: Code=12NS\*4P-AME Name=2012 NSTI 4.sem povinné AME

|   |  |    |   |
|---|--|----|---|
| 2121056   | Gas Dynamics                                     | ZK | 4 |
| The study subject's aim is to expand the students' knowledge gained from the previous "Alfa" versions of the bachelor's subjects Fluid Mechanics and Thermomechanics. It generalizes the findings in the scope of compressible fluid flow; the attention is focussed on the several non-isentropic cycles as well as fundamentals of non-stationary and multidimensional flows.   |  |    |   |
| 2311091   | System Identification                            | ZK | 3 |
| 2111035   | Finite Element Method II.                        | ZK | 3 |
| 2383062   | Budget and Project Economic Assessment           | Z  | 2 |
| The goal of the course is to improve the knowledge gained within the basic bachelor's degree course Management and Economics of the Enterprise. The course focuses primarily on deepening of basic knowledge and skills in the creation and evaluation of the operational budget, proper preparation and evaluation of costing model for manufactured products and the economic evaluation of an investment project, as it corresponds to contemporary knowledge and the development of management methods and techniques. Students specify a simple fictional industrial or engineering company or its sub-section (preferably inspired by their practical experience, internships or training program in real company). The first student's task is to prepare a detailed plan and budget of a project (e.g. new product development, product or process innovation, etc.) focused on improvement of profitability, competitiveness or effectiveness of the company. The second task is cost calculation for chosen calculation unit. Last task within this course is the evaluation of economical effectiveness of the project described within the first task. The dynamic methods like Net Present Value (NPV), Internal Rate of Return (IRR) or Discounted Payback Period (DPP) are used for this evaluation. The quality of realization and presentation of the task's outputs together with the results of the test decides on granting / denial of credit. |  |    |   |
| 2311019   | Synthesis and Optimization of Mechanical Systems | ZK | 3 |
| 2311084   | Advanced Dynamics                                | ZK | 3 |
| 2113017   | Basic of Engineering Experimentals               | Z  | 3 |

The aim of the course for the students is to apply their knowledge of mechanics, elasticity and strength and fluid mechanics to a complex task consisting in design of controlled mechanism according to required function, dimensioning of selected member in terms of stiffness and durability, environmental assessment and control design. The student is led to master a suitable combination of analytical and numerical methods. At the same time, topics from subjects taught in the 1st semester of the program are discussed within the contact hours.

The aim of the course for student is to solve the technical task assigned according to his specialization and focus. The task is focused on more advanced work with contemporary means of engineering analysis from commercial programs of FEM and fluid analysis, through Matlab to creation of in-house programs. The project continues and extends the knowledge acquired in subjects taught in the 2nd semester.

|---------|--|------------|---------|
| 2013054 | Mathematics for Mechanics<br>Summary: Tensor calculus. Introduction to functional analysis. Calculus of variations. • Orthogonal transformation of coordinate systems. • Afinne orthogonal tensors and tensor operations. • Tensor as linear operator and bilinear form. • Metrics and metric spaces. Convergence. Completeness. • Linear normed space. Banach space. • Linear space with scalar product (unitary space). Hilbert space. • Contractive operators and Banach fixed point theorem. • Function spaces in examples. • Operators and functionals. Linear, continuous and bounded operator/functional. • Derivative of a functional in the given direction. Gateaux differential and derivative. • Necessary and sufficient conditions for extremes of a functional. • Convex set and convex functional. Minimum of convex functional. • Extremes of functional of different types. Euler equation. Necessary and sufficient conditions for extrema. • Discrete methods for approximation of the minima of an functional. Ritz method. | Z          | 4       |

| 2111035   | Finite Element Method II.          | ZK | 3  |
| 2111049   | Theory of elasticity               | ZK | 4  |
| The objective of this course is an introduction to the theory and applications of linear elasticity. It also provides the foundation for pursuing other solid mechanics courses such as theory of plasticity, fracture mechanics, composite structures, theory of plates and shells or continuum mechanics. This course introduces the basic definitions of stress and strain tensors used in the linear theory of elasticity, determines the principal stress and strain, derives equilibrium equations, compatibility conditions for strain tensor, postulates the constitutive relations for linear elastic material (generalized Hooke's law). The governing differential equations of elasticity are derived including the Navier's equation expressed in terms of the displacement vector and the Beltrami-Michell's equation expressed in terms of the stress tensor. Next, two-dimensional problems in cartesian and cylindrical coordinate systems is considered and the Airy stress function is introduced for the solution of these problems. A few useful applications are studied such as bending of a beam using the Airy stress function in the form of a polynomial, the stress distribution in a plate with small circular hole submitted to a uniform tension, the stress distribution for a concentrated vertical force action on a horizontal straight boundary, the stress distribution in a wedge due to a concentrated force at its apex. Finally, a brief introduction to the energy principles in solid mechanics is presented including the principles of virtual displacements and virtual forces. |                                    |    |    |
| 2111083   | Continuum Mechanics                | ZK | 4  |
| 2113017   | Basic of Engineering Experimentals | Z  | 3  |
| 2113111   | Project I.                         | Z  | 5  |
| 2113112   | Project II.                        | Z  | 5  |
| 2113113   | Project III.                       | Z  | 10 |
| 2113998   | Diploma Project                    | Z  | 10 |
| 2121016   | Theoretical Fluid Mechanics        | ZK | 4  |
| The study subject aim is to expand the students' knowledge gained from the previous subject Thermomechanics Alfa. The attention is focussed namely on fluids characteristics, various description methods of fluid dynamics under low and high Re number values, boundary layer characteristics and its stability and complex flow characteristics for incompressible flow.   |                                    |    |    |
| 2121027   | Aerodynamics                       | ZK | 3  |
| The subject is oriented on study of flowing fluids behavior with applications in technical praxis with emphasizes on flow of air. Lectures are focused on flow stability, turbulence, flow around bodies and interaction of flow with surfaces.   |                                    |    |    |
| 2121043   | Computational Fluid Mechanics      | ZK | 4  |
| This course extends the knowledge gained in the course of Fluid Mechanics about the knowledge of computational fluid dynamics. Emphasis is placed on understanding the basic principles of computational fluid dynamics based on using commercial codes. Selected problems of internal and external aerodynamics are solved.  |                                    |    |    |
| 2121055   | Thermodynamics                     | ZK | 4  |
| The aim of the course is to expand the students' knowledge gained from the previous course Thermomechanics Alfa in the areas of the real gas thermodynamics, irreversible process thermodynamics, multiphase- and multicomponent system characteristics and thermodynamics cycles of the real heat engines and machines also.   |                                    |    |    |
| 2121056   | Gas Dynamics                       | ZK | 4  |
| The study subject's aim is to expand the students' knowledge gained from the previous "Alfa" versions of the bachelor's subjects Fluid Mechanics and Thermomechanics. It generalizes the findings in the scope of compressible fluid flow; the attention is focussed on the several non-isentropic cycles as well as fundamentals of non-stationary and multidimensional flows.   |                                    |    |    |
| 2123018   | Heat and Mass Transfer             | Z  | 2  |
| The course extends the knowledge gained in the subject Thermomechanics Alfa especially in the area of heat transfer. Attention is paid to more complex cases (non-stationary, multidimensional problems) as well as to processes where heat transfer is accompanied by simultaneous mass transfer (mixing exchangers).  |                                    |    |    |
| 2123111   | Project I.                         | Z  | 5  |
| The aim of the course for the students is to apply their knowledge of mechanics, elasticity and strength and fluid mechanics to a complex task consisting in design of controlled mechanism according to required function, dimensioning of selected member in terms of stiffness and durability, environmental assessment and control design. The student is led to master a suitable combination of analytical and numerical methods. At the same time, topics from subjects taught in the 1st semester of the program are discussed within the contact hours.  |                                    |    |    |

| 2313998 | Diploma project<br>individual assignment   | Z    | 10 |
| 2383062 | Budget and Project Economic Assessment<br>The goal of the course is to improve the knowledge gained within the basic bachelor's degree course Management and Economics of the Enterprise. The course focuses primarily on deepening of basic knowledge and skills in the creation and evaluation of the operational budget, proper preparation and evaluation of costing model for manufactured products and the economic evaluation of an investment project, as it corresponds to contemporary knowledge and the development of management methods and techniques. Students specify a simple fictional industrial or engineering company or its sub-section (preferably inspired by their practical experience, internships or training program in real company). The first student's task is to prepare a detailed plan and budget of a project (e.g. new product development, product or process innovation, etc.) focused on improvement of profitability, competitiveness or effectiveness of the company. The second task is cost calculation for chosen calculation unit. Last task within this course is the evaluation of economical effectiveness of the project described within the first task. The dynamic methods like Net Present Value (NPV), Internal Rate of Return (IRR) or Discounted Payback Period (DPP) are used for this evaluation.<br>The quality of realization and presentation of the task's outputs together with the results of the test decides on granting / denial of credit. | Z    | 2  |
