Study plan

Name of study plan: Master branch Computer Security, in Czech, 2016-2019

Faculty/Institute/Others:

Department:

Branch of study guaranteed by the department: Welcome page

Garantor of the study branch:

Program of study: Informatics, valid until 2024

Type of study: Follow-up master full-time

Required credits: 94

Elective courses credits: 26 Sum of credits in the plan: 120

Note on the plan: Tato verze studijního plánu je ur ena pro ro ník, který byl p ijat ke studiu v akademickém

roce 2016/2017 do prezen ní formy studia magisterského programu.

Name of the block: Compulsory courses in the program

Minimal number of credits of the block: 54

The role of the block: PP

Code of the group: MI-PP.2016

Name of the group: Compulsory Courses of Master Study Program, Version 2016, in Czech

Requirement credits in the group: In this group you have to gain 54 credits

Requirement courses in the group: In this group you have to complete at least 6 courses

Credits in the group: 54

Note on the group: Opakovaně do studia zapsaní studenti s uznatelnou zkouškou z PAR mohou požádat o uznání

zkoušky z předmětu PDP.# Opozdilcům: Student, kteremu chybí PPR, si zapíše PDP a získá z něj zápočet.# Do studia opakovaně zapsaným studentů: student se zkouškou z PPR má právou na

uznání zápočtu z PDP.

Characteristics of the courses of this group of Study Plan: Code=MI-PP.2016 Name=Compulsory Courses of Master Study Program, Version 2016, in Czech

MI-DIP	Diploma Project	Z	23
MI-MPR	Master Project	Z	7

1. At the beginning of the semester, a student reserves her/his final thesis topic and gets together with its supervisor. Together they decide on partial tasks that should be carried out during the semester. If the requirements they agreed upon are met, the supervisor awards the student an assessment for the course MI-MPR at the end of the semester. 2. External Master these (MT) supervisor fills his/her assessment into the paper "Form to award assessment by an external Final theses (FT) supervisor" (for the courses BIE-BAP, MIE-MPR, MIE-DIP). Students, then, ensure that the assessment is registered into the information system (IS) by asking their internal FT opponent to award the assessment to the IS based on the confirmation of the external MT supervisor. In the case the FT opponent is external as well, the assessment will be registered to the IS by the head of the department responsible for the topic of the MT. 3. If the FT topic that the student has reserved is rather general, the immediate tasks the supervisor assigns to the student for the upcoming semester should aim at fine-tuning the FT topic so that the FTT will be complete and approvable at the end of the semester.

MI-MPI Mathematics for Informatics Z,ZK 7

The course comprises topics from general algebra with focus on finite structures used in computer science. It includes topics from multi-variate analysis, smooth optimization and multi-variate integration. The third large topic is computer arithmetics and number representation in a computer along with error manipulation. The last topic includes selected numerical algorithm and their stability analysis. The topics are completed with demonstration of applications in computer science. The course focuses on clear presentation and argumentation.

MI-PDP.16 Parallel and Distributed Programming

Z,ZK

C Onlication

Due to the development of cloud, web, and communication technologies and due to the shift of the Moore law into multicore and manycore CPUs, parallel and distributed applications are becoming ubiquitous. Students get acquainted with architectures of parallel and distributed computing systems, their models, theory of interconnection networks, and languages and environments for parallel programming of shared and distributed memory computers. On selected problems, they will learn the techniques of design of efficient and scalable parallel algorithms and methods of performance evaluation of their implementations.

MI-PAA Problems and Algorithms

Students are able to evaluate discrete problems by complexity and by the purpose of optimisation (on-line tasks, multicriterial optimisation). They understand principles and properties of heuristics and exact algorithms and, therefore, are able to select, apply, and experimentally evaluate a suitable heuristics for a practical problem.

MI-SPI 16 Statistics for Informatics Z,ZK

Summary of probability theory; Multivariate normal distribution; Entropy and its application to coding; Statistical tests: T-tests, goodness of fit tests, independence test; Random processes - stacionarity; Markov chains and limiting properties; Queuing theory

Name of the block: Compulsory courses of the specialization

Minimal number of credits of the block: 35

Characteristics of the courses of this group of Study Plan: Code=MI-PO-PB.2016 Name=Compulsory Courses of Master Branch Computer Security, Version 2016, in Czech

MI-HWB.16 Hardware Security Z.ZK

The course provides the knowledge needed for the analysis and design of computer systems security solutions. Students get an overview of safeguards against abuse of the system using hardware means. They will be able to safely use and integrate hardware components into systems and test them for resistance to attacks. Students will gain knowledge about the cryptographic accelerators, PUF, random number generators, smart cards, biometric devices, and devices for internal security functions of the computer.

MI-MKY.16 Mathematics for Cryptology

Students become familiar with parts of mathematics necessary for deeper understanding of the methods used in symmetric and asymmetric cryptography. They learn the mathematical

principles on which security of encryption systems, cryptanalysis methods, cryptography over elliptic curves, and quantum cryptography are based.

Modern Internet Technologies

Students learn technologies of the modern Internet. links of the IP technology to the modern communication networks, mechanisms for multicasting and real-time communication, more efficient mechanisms of virtual channels, and the new IPv6 architecture. They will understand the issues of monitoring and management of large computer networks. They are introduced to the technologies of interconnection networks for HPC systems.

Advanced Cryptology MI-KRY.16

7.7K

Students will learn the essentials of cryptanalysis and the mathematical principles of constructing symmetric and asymmetric ciphers. They will know the mathematical principles of random number generators. They will have an overview of cryptanalysis methods, elliptic curve cryptography and quantum cryptography, which they can apply to the integration of their own systems or to the creation of their own software solutions.

MI-REV.16 Reverse Engineering

Z.ZK

Students will get acquainted with the essentials of reverse engineering of computer software. They will learn how processes start and what happens before and after the main function is called. Students will understand how executable files are organized and how they interact with 3rd party libraries. Another part of the course is dedicated to reverse engineering of applications written in C++. Students will also understand principles of disassemblers and obfuscation techniques. A part of the course will also be dedicated to debuggers: how debuggers and debugging work and which methods can be used to detect it. One of the lectures will be dedicated to the latest trends on the computer malware scene. The focus of the course is on the seminars, where students will solve practically oriented tasks from the real world.

MI-SIB.16 **Network Security**

Z,ZK

The students will gain theoretical and practical knowledge and experience in the area of current security threats in computer networks, specifically about detection and defense. The course explains basic pricipals of security monitoring, packet-based and flow-based analysis, in order to detect anomalies and suspicious network traffic. The course focuses on explanation and practical examples of various mechanisms of securing network infrastructure and detection in real time. The course covers general principals of handling detected security events (i.e. incident handling and incident response).

MI-SYB.16 System Security

Students will familiarize themselves with the actual ICT security needs in all ICT disciplines. Students will gain knowledge of typical network attacks and protection against them, together with essential communication encryption techniques. They will learn how to work with certain aspects of encryption techniques - passwords and certificates. After that, students will learn the basics of anti-virus, anti-spam and heuristic analyses used in modern anti-virus solutions or Unified Threat Management (UTM) based solutions. They will also learn the principles of securing websites, web applications and databases. Upon completion of the module, students will have a broad overview of IT security and will be able to apply it to the integration of various software systems and applications.

Name of the block: Compulsory elective economic-management courses

Minimal number of credits of the block: 2

Code of the group: MI-PV-EM.2016

Name of the group: Compulsory Elective Master Economics and Management Courses, in Czech, Ver. 2016

Requirement credits in the group: In this group you have to gain at least 2 credits (at most 6)

Requirement courses in the group: In this group you have to complete at least 1 course (at most 2)

Credits in the group: 2

Note on the group:

Opakovaně do studia zapsaným studentům: Má-li student uznaný předmět PRM, nelze ho

uznat jako náhradu za nový předmět PCM (student musí vypracovat projekt).

Code	Name of the course / Name of the group of courses (in case of groups of courses the list of codes of their members) Tutors, authors and guarantors (gar.)	Completion	Credits	Scope	Semester	Role

Characteristics of the courses of this group of Study Plan: Code=MI-PV-EM.2016 Name=Compulsory Elective Master Economics and Management Courses, in Czech, Ver. 2016

FI-VEZ	economic-managerial course from a study abroad	Z	4
A "Humanities subject t	hat has been studied abroad" is covered by the Humanities subject from a study abroad in Compulsory Humanities Module t	hat is required in	the curriculum.
The substitution is appr	oved by the Vice-Dean for study affairs on behalf of the Dean at the request of the student.		
MI-IBE	Information Security	ZK	2
Students learn informat	ion and IS/ICT security management systems (ISMS), methods for information access control, and basic norms and internat	ional standards in	this area. They
understand methods fo	management of internal and external security threats, for IS/IT security audits, and for application security testing (e.g., pen	etration testing).	
MI-MPX	Management practice	Z	4
The Student can once,	within its master's degree graduate (to apply) management practices in the selected subject of practice (business subject) on t	he operational, ta	ctical or strategic
level of management (ty	rpically at the position of project manager, middle or top manager). The selected subject of practice and professional filling is	assessed well in	advance the
course guarantor. In the	selected subject of practice may not have a substantial ownership interest or substantial decision-making influence of the re	latives of the stud	lent (e.g. as a
member of the top man	agement).		
MI-PCM.16	Project And Change Management	KZ	3
This course is presente	d in Czech.		1
MI-SEP	World Economy and Business	Z,ZK	4
This course is presente	d in Czech. However, there is an English variant in the program Informatics (N1801 / 4793). The course introduces students (of technical univer	sity to the
international business.	t does that predominantly by comparing individual countries and key regions of world economy. Students get to know about o	different religions	and cultures,
necessary for doing bus	siness in diverse societies as well as indexes of economic freedom, corruption and economic development, which are needed	d for the right inve	stment decision.
Seminars help to impro	ve on the knowledge in the form of discussions based on individual readings. It is advised to take bachelor level of this cours	e BIE-SEP as a p	rerequisite.

n this course, the students get acquainted with classification methods used in four important internet, or generally network applications: in sparr	-	·=
n malware detection systems and in intrusion detection systems. However, they will learn more than only how classification is performed when	_	-
On the background of these applications, they get an overview of the fundamentals of classification methods. The course is taught in a 2-weeks	=	
exercises. During the exercises, the students on the one hand implement simple examples to topics from the lectures, on the other hand consultant.		1
MI-AFP Applied Functional Programming	KZ	5
This course is prezented in Czech. Functional programming represents one of the traditional programming paradigms. Traditional and novel functions are traditional programming paradigms. Traditional and novel functions are traditionally important as a functional programming paradigms.		
he rise nowadays and the functional paradigm becomes an important construct of traditionally imperative languages (C++, C#, Java). As such,	mastering this paradi	gm becomes a
ecessary competence of a software engineer: the theory and especially the practice.	7.71	
MI-APH Architecture of computer games	Z,ZK	4
Students will gain a basic understanding of the various issues in the field of computer game development, from both the technical and creative		
component-oriented architecture, game mechanics, and game AI that form an integral part of most games. They will also understand the basics of	or pathrinding, network	ing, and script
and apply them in practical exercises (labs).		
MI-BML Bayesian Methods for Machine Learning	KZ	5
he subject is focused on practical use of basic Bayesian modeling methods in the dynamically evolving machine learning theory. In particular, it		
nodels providing description of real phenomena, as well as their subsequent use, e.g., for forecasting of future evolution or learning about the h	,	
rom noisy observations etc.). The emphasis is put on understanding of explained principles and methods and their practical adoption. For this pur		-
and applications will be presented to students, for instance, 2D/3D object tracking, radiation source term estimation, or separation in medical im	naging. The students v	vill try to solve
some of them.		
MI-BPS Wireless Computer Networks	Z,ZK	4
Students will learn about the modern technologies, protocols, and standards for wireless networks. They will understand the routing mechanism		
roadcast mechanisms, and data flow control mechanisms. They will also learn about principles of communication in sensor networks. They get	t knowledge of securit	y mechanisms
or wireless networks and get skills of configuration of wireless network elements and simulation of wireless networks using suitable tools.		
MI-DSP Database Systems in Practes	Z,ZK	4
his course is presented in Czech.	•	•
MI-DZO Digital Image Processing	Z,ZK	4
This course presents a comprehensive overview of modern methods for interactive editing of digital images and video. It mainly deals with pract	tical algorithms that a	re both easy to
mplement and have an interesting theoretical basis. Visually attractive applications provide better understanding of basic theoretical background t	that is also valuable ou	utside the doma
of digital image processing. This course will introduce algorithms solving the following practical applications: edge-aware editing, tone mapping,	HDR compression, d	e-blurring in
requency domain, abstraction, hybrid images, gradient domain editing, seamless image stitching and cloning, digital photo-montage, color-to-g		
nteractive as-rigid-as-possible image deformation, free-form image registration, texture synthesis, interactive segmentation, colorization, paintir	ng, adding depth, alph	a matting.
	ng, adding depth, alph	a matting.

NI-MOP Modern Object-Oriented Programming in Pharo	KZ	4
Object-oriented programming is currently one of the most widespread paradigms of software creation, especially enterprise information systems, wh		· ·
is used to build complex modern applications. In this course, we build on the knowledge acquired in the course BI-OOP and aim to further deepen the	skills of design and	dimplementation
of object systems in modern pure object system Pharo (https://pharo.org). The course focuses on individual approach to students, their developmen		
addition to deepening object programming skills, which are generally applicable in other OO languages, students will also gain the opportunity to we technologies in terms of semestral work with the possibility of cooperation with practice and related bachelor, diploma, postgraduate our direct involved.		-
MI-MPC Modern programming in C ++	Z.ZK	5
Students learn how to use the modern features of contemporary versions of the C++ programming language for software development. The course f	,	_
and efficiency in the form of writing maintainable and portable source code and creating correct programs with low memory and processor time requ	uirements.	
MI-MAI Multimedia and Internet	Z,ZK	3
The course will cover principles and technologies for processing and network transmissions of multimedia signals, stereoscopy and visualizations in happlication areas of networked multimedia, transmission formats, interfaces, codecs, technologies for acquisition and reproduction of multimedia data	-	
and distributed collaboration using networking and immersive environments.	and technologies	ioi visualizations
MI-OLI Linux Drivers	Z,ZK	4
The Linux operating system is an important operating system for personal computer and also for embedded systems. Systems on chip and combining	g powerful proces	sors and FPGAs
increase the variability of peripheral subsystems requiring specific software drivers. This course is an advanced course in the Linux driver developm		udents. The
course provides knowledge of Linux operating system architecture, principles of development of various types drivers, including practical experience MI-ARI Computer arithmetic	z,ZK	4
Students will learn various data representations used in digital devices and will be able to design arithmetic operations implementation units.	2,213	+
NI-PG1 Computer Grafics 1	ZK	4
The course builds on graphic courses (mainly BI-PGA and BI-PGR) and the knowledge from these courses is deepened by state-of-the-art knowledge		•
interested in advanced computer graphics. Students will gain practical knowledge with realistic texturing and raytracing methods. An integral part of the students will be followed by a gauge PC3 supplementing the knowledge of PC4 on other stages and		-
articles and their subsequent implementation. The course will be followed by a course PG2 supplementing the knowledge of PG1 on other areas an MI-PVR Advanced Virtual Reality	KZ	ter graphics.
The course introduces advanced parts of the virtual reality. It is a continuation of the already running graphic objects, especially the creation of 3D m.		
things, it introduces students to their application in virtual reality. Lectures will focus on virtual reality technology, its use in various applications and will a		-
in available 3D engines (mainly Unity3D). The course is freely connected with the subject VHS (virtual game worlds), students will be able to apply the	e knowledge gain	ed in this subject
in virtual reality, or directly create a complex game for VR.	7.71/	
NI-AML Advanced machine learning The course introduces students to selected advanced topics of machine learning and artificial intelligence. The topics present techniques in the field o	Z,ZK	systems image
processing, control and interconnection of physical laws with the field of machine learning. The aim of the exercise is to familiarize students with the		
MI-IOS Advanced techniques in iOS applications	KZ	4
Students will learn the latest trends in mobile development technologies for iOS platform. Class covers advanced topics, students need to know all the	e basics from the	beginners class
BI-IOS.	7.71/	
MI-PVS Advanced embedded systems The course is focused on ARM processors and microcontrollers and their usage in wide range of applications. The course includes a series of advanced embedded systems	Z,ZK	4 ecurity support
working with mass storage devices, motor control, system control and industrial communication. The students obtain both theoretical and also pract	-	
systems.		
MI-DNP Advanced .NET	Z,ZK	4
Students acquire a knowledge about advanced desgin of applicatios on a .NET platform. They gain skills of WPF (Windows Presentation Foundation Communication Foundation) and Entity France and Language and Applications of Applications and Applica		(Windows
Communication Foundation) and Entity Framework. They are able to apply these skills on a development and desgin of advanced .NET applications MI-PYT Advanced Python	KZ	4
The goal of this course is to learn various advanced techniques and methods in Python. The course indirectly continues where Programming in Python.	1	I -
very hands-on and it has only tutorials, everything is demonstrated on examples. Classification is based on work in class as well as semestral coursew		
teachers from Red Hat.		
MI-PRC Programming in CUDA The students gain a good everyion of present parallel architectures in CPUs. Students also get hands an experience with programming these systems.	Z,ZK	4
The students gain a good overview of present parallel architectures in GPUs. Students also get hands-on experience with programming these system MI-PSL Programming in Scala	ms. Z,ZK	4
The course introduces the modern programming language Scala which exploits object-functional paradigm. Scala comprises advance language fea		· ·
advance standard library. Scala enables to use of applications functional patterns e.g. H-List, Monads, etc. Scala is used by many powerful frameworks		_
Scalaz, etc.		

MI-RUB Programming in Ruby This course is presented in Czech.	KZ	4
MI-ROZ.16 Pattern Recognition	Z,ZK	5
The aim of the module is to give a systematic account of the major topics in pattern recognition with emphasis on problems and applications of the	1 ' 1	- 1
recognition. Students will learn the fundamental concepts and methods of pattern recognition, including probability models, parameter estimation,	and their numerical	aspects.
MI-RRI Risk Management in Informatics	ZK	3
Information security is very often considered as one of main objectives to secure targets of information processing. However, to focus on this info s		
IT systems against viruses, malware etc. very often means misunderstanding and underestimating of real threats which are around us and which ar other malware. The necessity to continue with business after disaster is also slightly ignored. International standards which are focused on informa		
during last years started to anticipate necessity of risk management. There is no commonly accepted methodology used for this task. Threats which		
worldwide, invoke pressures to prepare plans for business continuity management even in the case of dramatic political changes, natural disasters		
MI-SCE1 Computer Engineering Seminar Master I	Z	4
The Seminar of Computer Engineering is a (s)elective course for students who want to deal with deeper topics of digital design, reliability and resistant		
are approached individually within the subject. Each student or group of students solves some interesting topic with the selected supervisor. Part of		
articles and other professional literature and/or work in K N laboratories. The capacity of the subject is limited by the possibilities of the seminar teasemester.	acners. The topics a	are new for each

MI-TNN Theory of Neural Networks	Z,ZK	4
In this course, we study neural networks from the point of view of the theory of function approximation and from the point of view of probability theory	ry. At first, we recal	basic concepts
pertaining to artificial neural Networks, such as neurons and connections between them, types of neurons from the point of view of signal transmiss	=	
synaptic mappings, network training, and the role of time in neural networks. In connection with network topology, we get acquainted with its transfer		
and in connection with somatic and synaptic mappings, with their composition into mappings computed by the Network, Finally in connection with the standard of the first that training is not at the second the second training to the second the second training that the second training to the second training to the second training to the second training training to the second training traini		
problem of overtraining and to the fact that training is actually a specific optimization task, recalling the most typical objective functions and the most employed for neural network training. We will see the meanining of all these concepts in the context of common kinds of forward neural networks. With		
to neural networks, we first notice the connection of neural networks to expressing functions of many variables using functions of fewer variables (
theorem). Afterwards, we will see how the universal approximation capacity of neural networks can be mathematically formalized as the sets of map	-	
being dense in important Banach spaces of functions, in particular in the spaces of continuous functions, spaces of functions integrable with respe	ct to a finite measu	re, spaces of
functions with continuous derivatives, and Sobolev spaces. Within the topic probabilistic approach, we first get acquainted with training based on experience of the continuous derivatives.	-	_
random sample, and with probabilistic assumptions about training data with which those two kinds of neural networks can be employed. We will see	· · · · · · · · · · · · · · · · · · ·	-
of the conditional expectancy of network outputs conditioned by its inputs using the expectancy based learning. We recall the strong and the weak	-	_
acquainted with an analogy of the strong law of large numbers for neural networks and with the assumptions for its validity. Finally, we recall the ce with its analogy for neural networks, with the assumptions for its validity and with the hypothesis tests based on it. We will see how those tests can		
topology of the network.	be employed to see	archi for the
MI-VEM Scientific thinking	KZ	2
The objective of the course is to get acquainted with scientific methods and discovery of order and laws of the universe, including the aspects of hu	1 1	
scientific methods in natural sciences, mathematics, computer science and humanities. Another aim is to introduce rules and requirements of science	ntific communication	via research
papers and posters.		

Students understand a	chitecture of systems based on multicore processors with multiple threads per core, structure and usage of cache hierarchy	with shared last le	evel. They learn
parallel algorithm class	ification, parallel programming technics, simulation and monitoring tools for measurement and optimization of parallel algorith	ms. After this cour	rse, students can
design MTMD program	s (Multiple Threads Multiple Data), measure and analyze latency and throughput of parallel algorithms and optimize them for	contemporary mu	ulticore systems.
MI-VYC	Computability	Z,ZK	4
Classical theory of recu	risive functions and effective computability, with applications in provability theory.		
NI-VPR	Research Project	Z	5
Student obtains the cre	dits for published scientific outputs. The details are at https://courses.fit.cvut.cz/NI-VPR/en.		
MI-ZS10	Master internship abroad for 10 credits	Z	10

Each student can once within his / her master's degree have a foreign internship at a foreign university or other foreign scientific and/or research institution. Before the internship the Dean of the FIT, or the vice-dean for study affairs assesses the professional content. The student must provide evidence of the professional content and extent of the internship. Auxiliary courses MI-ZS10, MI-ZS20, MI-ZS30 are used used for the evidence and evaluation of the internship in IS KOS. Every 10 credits correspond to 4 weeks of full-time employment with a foreign institution. The maximum number of credits a student can earn for one internship is 30 credits. This amount can be divided into two subjects if the internship exceeds the academic year's dead-line.

MI-ZS20 Master internship abroad for 20 credits

Multicore Systems

Each student can once within his / her master's degree have a foreign internship at a foreign university or other foreign scientific and/or research institution. Before the internship the

Dean of the FIT, or the vice-dean for study affairs assesses the professional content. The student must provide evidence of the professional content and extent of the internship. Auxiliary courses MI-ZS10, MI-ZS20, MI-ZS30 are used used for the evidence and evaluation of the internship in IS KOS. Every 10 credits correspond to 4 weeks of full-time employment with a foreign institution. The maximum number of credits a student can earn for one internship is 30 credits. This amount can be divided into two subjects if the internship exceeds the academic year's dead-line.

MI-ZS30 Master internship abroad for 30 credits

Each student can once within his / her master's degree have a foreign internship at a foreign university or other foreign scientific and/or research institution. Before the internship the Dean of the FIT, or the vice-dean for study affairs assesses the professional content. The student must provide evidence of the professional content and extent of the internship. Auxiliary courses MI-ZS10, MI-ZS20, MI-ZS30 are used used for the evidence and evaluation of the internship in IS KOS. Every 10 credits correspond to 4 weeks of full-time employment with a foreign institution. The maximum number of credits a student can earn for one internship is 30 credits. This amount can be divided into two subjects if the internship exceeds the academic year's dead-line.

Characteristics of the courses of this group of Study Plan: Code=MI-PB-VO.2017 Name=Elective Vocational Courses for Master Branch MI-PB, version 2017

MI-PCM.16 Project And Change Management	KZ	3
This course is presented in Czech.		
MI-ADM.16 Data Mining Algorithms	Z,ZK	5
The course focuses on algorithms used in the fields of machine learning and data mining. However, this is not an introductory course, and the stude	nts should know n	nachine learning
basics. The emphasis is put on advanced algorithms (e.g., gradient boosting) and non-basic kinds of machine learning tasks (e.g., recommendation	systems) and mod	dels (e.g., kernel
methods).		
MI-ADP.16 Architecture and Design Patterns	Z,ZK	5
The objective of this course is to provide students with both work knowledge about the underlying foundations of object-oriented design and analysis		inderstanding of
the challenges, issues, and tradeoffs of advanced software design. In the first part of the course, the students will refresh and deepen their knowledge	ge of object-orient	ed programming
and get familiar with the commonly used object-oriented design patterns that represent the best practices for solving common software design problem	ns. In the second p	part the students
will be introduced to the principles of software architecture design and analysis. This includes the classical architectural styles, component based systems	ms, and some ad	vanced software
architectures used in large-scale distributed systems.		
MI-BPR Security and Secure Programming	Z,ZK	4
The students will learn how to assess security risks and how to take them into account in the design phase of their own code and solutions. After getting	ng familiar with the	threat modeling
theory, students gain practical experience with running programs with reduced privileges and methods of specifying these privileges, since not every		
administrator privileges. Dangers inherent in buffer overflows will be practically demonstrated. Students will be introduced to the principles of securin	g data and the re	lationships of
security and database systems, web, remote procedure calls, and sockets in general. The module concludes with Denial of Service attacks and the	defense against th	nem.
MI-BHW.16 Security and Hardware	Z,ZK	5
Students gain a basic knowledge in selected topics of cryptography and cruptanalysis. The module focuses particularly on elliptic curve cryptography	•	•
cryptographic systems. Students gain a good overview of the functionality of (hardware) cryptographic accelerators, random number generators, smart	cards, and resou	rces for securing
of internal functions of computer systems.		
MI-BKO.16 Error Control Codes	Z,ZK	5
The goal of the course is to present various ways to detect or correct individual errors and burst errors in data stored into memories or transmitted vi	a channels.	
MI-DSV.16 Distributed Systems and Computing	Z,ZK	5
Students are introduced to methods for coordination of processes in distributed environment characterised by nondeterministic time responses of compu	ting processes and	d communication
channels. They learn basic algorithms that assure correctness of computations realized by a group of loosely coupled processes and mechanisms the	at support high a	vailability of both
data and services, and safety in case of failures.		
MI-DDW.16 Web Data Mining	Z,ZK	5
Students will learn latest methods and technologies for Web data acquisition, analysis and utilization of the discovered knowledge. Students will gair	n an overview of W	Veb mining
techniques for Web crawling and search, Web structure analysis, Web usage analysis, Web content mining and information extraction. Students will	also gain an over	view of most
recent developments in the field of social web and recommendation systems.		
MI-FME.16 Formal Methods and Specifications	Z,ZK	5
Students are able to describe semantics of software formally and to use sound reasoning for construction of correct software. They learn to use some	software tools th	at allow to prove
basic properties of software.		
MI-FLP Functional and Logical Programming	Z,ZK	4
Students will be acquainted with principles of functional and logic programming. They will be able to write their programs in Lisp and Prolog program	ming languages.	
MI-GEN Code Generators	Z,ZK	4
Students will become acquainted with both theoretical and practical aspects of back-end of an optimizing programming language compiler.		
MI-KOD.16 Data Compression	Z,ZK	5
Students are introduced to the basic principles of data compression. They will learn the necessary theoretical background and get an overview of da	ta compression m	nethods being
used in practice. The overview covers principles of integer coding and of statistical, dictionary, and context data compression methods. In addition, si	tudents learn the	fundamentals of
lossy data compression methods used in image, audio, and video compression.		
MI-MVI.16 Computational Intelligence Methods	Z,ZK	5
Students will understand methods and techniques of computational intelligence that are mostly nature-inspired, parallel by nature, and applicable to	many problems. T	They will learn
how these methods work and how to apply them to problems related to data mining, control, intelligen games, optimizations, etc.		
MI-MEP.16 Modelling of Business Processes	Z,ZK	5
The subject is focused on introduction to the discipline of Enterprise Engineering. Students learn the importance of a proper methodological approach	ch for (re)enginee	ring and
implementation of processes, organisation structures and information support in big enterprises and institutions.		
MI-NFA.16 Design for the FPGA and ASIC Technology	Z,ZK	5
Students gain the basic knowledge needed to start a career in a design house. They will understand the FPGA and ASIC implementation technological students are career in a design house.		
technologies impose on the design. They are able to perform and to manage typical workflows, their analytic and synthetic steps, with an emphasis	on basic verification	on. They know
the structure and demands of software tools, as well as what to expect from them.		
MI-NUR.16 User Interface Design	Z,ZK	5

MI-NSS.16 Normalized Software Systems	ZK	5
Students will learn the foundations of Normalized Systems theory, which studies the evolvability of modular structures based on concepts from engin systems theory and entropy from thermodynamics. Initially, the theory was developed at the level of software architectures, where the concept of stability	-	·=
of so-called combinatorial effects. These effects occur when the impact of a change to the software architecture is dependent on the change itself, as		
The latter is highly undesirable, as it will cause even a simple change to incur an ever-increasing impact as the size of the system grows over time. As		
be considered as a main cause of Lehman?s Law of Increasing Complexity (see, e.g., http://en.wikipedia.org/wiki/Lehman's_laws_of_software_evolution.		
entropy was used in the study of which micro-states in a modular structure correspond with a given macro-state. This is related mainly to issues such as	=	
Normalized Systems theory consists first of a set of principles which indicate where violations of stability and entropy-related issues occur in any give principles indicate that very fine-grained modular structures are required in order to control them. In the second part of the theoretical framework, it is s		
can be constructed based on a set of 5 design patterns called elements. These elements provide the core functionality of information systems in terms		
workflows, connectors and triggers, while controlling for violations of the stability and entropy-related principles, allowing them to realize new levels of evo	=	_
Recently, Normalized Systems theory was also applied to the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures, with the goal of control of the modular structures in business processes and enterprise architectures.	onstructing a four	dational theory
for Enterprise Engineering.	7 714	
MI-PAP.16 Parallel Computer Architectures The students gain a good overview of present parallel architectures and processors:parallel (ILP) microarchitectures, multithreaded and multicore processors.	Z,ZK	5
GPUs, and neural processors. Students also get hands-on experience with programming these systems.	icessurs, 300s ar	iu ivir 3008,
MI-EDW.16 Enterprise Data Warehouse Systems	Z,ZK	5
The Enterprise Data Warehouses course focuses on the area of business intelligence. Students will be introduced to business intelligence methods a	,	-
not only in designing warehouses and various architectures, but also their deployment and maintenance. This course also includes an introduction to	the area of report	ing and data
visualization.		
MI-POA.16 Advanced Computer System Architectures	Z,ZK	5
The student will learn the current trends in infrastructure architecture of complex business computer systems. After completion of the module, the stu complex system infrastructure that meets availability and scalability requirements given by the business environment.	dent will be able t	o design a
MI-PDB.16 Advanced Database Systems	Z,ZK	5
Students orient themselves in problems of evaluation and optimization of SQL queries. The next part of the course deals with new concepts of database.		-
databases), with the related new data models (XML, graph databases, column databases) and languages for working with them (XQuery, XPath, CY	•	
the course deals with performance evaluation of database machines.		
MI-PIS.16 Advanced Information Systems	Z,ZK	5
Students learn the notion of business process logic and its formalization, with business process roles, business rules, and data processing, with the notion enterprise services and service solution of business logic. They get acquainted with these notions also for the other types of ISs. They learn about ag		
artificial intelligence methods for implementation of these ideas in ISs. They understand modern object-oriented methodologies for modelling of busin		-
processed data, and enterprise ISs. They will get the rules and technologies for successful implementation of IS.		,
MI-PDD.16 Data Preprocessing	Z,ZK	5
Students learn to prepare raw data for further processing and analysis. They learn what algorithms can be used to extract parameters from various data		-
time series, etc., and learn the skills to apply these theoretical concepts to solve a specific problem in individual projects - e.g., parameter extraction to the series of the series		
MI-MBI.16 Management of Business Informatics This course is presented in Czech.	Z,ZK	5
MI-SWE.16 Semantic Web	Z,ZK	5
Students learn standards used for processing and sharing knowledge mainly in the area of web. They get used to designing and using knowledge mainly in the area of web.		_
and practical aspects as publishing, sharing, exchange, and acquisition of knowledge on the web. The presentation is based on the idea of the semantary and acquisition of knowledge on the web.		•
and technologies (RDF, RDFS, OWL) and formal models.		
MI-SMI.16 Strategic Management of Informatics	Z,ZK	5
The course focuses on the strategic management of information systems. Students will learn the process of creation and implementation of an information the importance of ICT for business and interrelations between information strategies and lobal business strategies. Furthermore, they gain the knowle		_
management of IS/IT, management of investments and ROI, assessment of IT investments and management of human resources in IT (the role of C	•	
course is the role of project management, risk management and quality assessment of informatics.	.0, 020, 0. 0)	10 part of 1110
MI-SOC.16 Systems on Chip	Z,ZK	5
Students gain key knowledge and skills in the design of large-scale digital systems. They will be familiar with architectures of such systems and comm	_	
will use an appropriate workflow to design these architectures, their hardware and software. They will also have knowledge of contemporary methods	of large systems	verification and
fault-tolerant systems design. MI-TES.16 Systems Theory	Z,ZK	5
MI-TES.16 Systems Theory Today, humankind has the ability to develop systems of incredible complexity (e.g., trains, microprocessors, airplanes, nuclear power plants). However,		
complexity and of ensuring the correct behavior of a given system have become critical. A key technique for mastering this complexity is the usage of		
aspects of the systems that are important for the task at hand, and automated tools for analyzing those models. This subject will present theory and a		
the modeling and analysis of complex systems.		
MI-TSP.16 Testing and Reliability	Z,ZK	5
Students gain knowledge about circuit testing and about methods for increasing reliability and security. They will get practical skills to be able to prepare intuitive path sensitization and to use an ATPG for automatic test generation. They will be able to design easy testable circuits and systems with built-		=
be able to analyze and control reliability and availability of the designed circuits.	ırı-seii-test equipi	nent. They will
MI-VMM.16 Retrieval from Multimedia	Z,ZK	5
The student obtains general knowledge regarding interfaces of portals providing multimedia content, the principles of similarity search, the methods of f	· · · · · · · · · · · · · · · · · · ·	
objects, indexing, and structure of distributed search engines.		
MI-W20.16 Web 2.0	Z,ZK	5
Students will learn new trends and technologies on the Web including theoretical foundations. Students will gain an overview about Web applications		= -
technologies about programmable Web (REST Architectures, Mashups), basic mechanisms for knowledge representation on the Web (microformats, n data, etc.), mechanisms about collective intelligence (collaborative filtering, predictions of users' behaviours), social networks, and security.	ieta-data, ontolog	ies, open iinked
MI-MDW.16 Web Services and Middleware	Z,ZK	5
Students learn new trends and technologies in the area of service-oriented architectures, web services, middleware, and cloud computing, including		

List of courses of this pass:

Code	Name of the course	Completion	Credits
BI-SOJ	Machine Oriented Languages	Z,ZK	4
	ourse will gain an ability to create their own programs in the assembly language of the most common PC platform focusing on optimal us eration of software with hardware. Next, there will be discussed x86 specifics of the majority of OSes from the application point of view lin This knowledge will be used during reverse engineering, optimization, and evaluation of code security.		
FI-FIL	Philosophy see A0B16	ZK	2

MI-KOD.16 **Data Compression** Z,ZK 5 Students are introduced to the basic principles of data compression. They will learn the necessary theoretical background and get an overview of data compression methods being used in practice. The overview covers principles of integer coding and of statistical, dictionary, and context data compression methods. In addition, students learn the fundamentals of lossy data compression methods used in image, audio, and video compression. MI-KRY.16 Advanced Cryptology Z,ZK 5 Students will learn the essentials of cryptanalysis and the mathematical principles of constructing symmetric and asymmetric ciphers. They will know the mathematical principles of random number generators. They will have an overview of cryptanalysis methods, elliptic curve cryptography and quantum cryptography, which they can apply to the integration of their own systems or to the creation of their own software solutions. MI-KYB.16 Cybernality ZK Students get acquainted with the fundamentals of legislation and international activities in the area of fighting cybercrime. Students will understand the classification of attacks and have an overview of systems for computer surveillance and traffic monitoring in the cyberspace. Students will also familiarize themselves with hacker activities and behavior. The course will also discuss the cooperation of the state agencies and subjects dealing with defence of the cyberspace (especially CSIRT and CERT teams). Linear Optimization and Methods MI-LOM.16 Students learn the applications of optimization methods in computer science, economics, and industry. They are aware of practical importance of linear and integer programming. They are able to work with optimization software and are familiar with languages used in programming of that software. They get skills in formalization of optimization problems in computer science (such as scheduling of tasks to processors, analysis of network flows), distribution and allocation of resources (transportation problems, travelling salesman problems, etc.), issues from economics, and modelling of conflicts via the game theory. They get an overview of computational complexity of optimization problems. They get orientation in algorithms in linear programming. MI-MAI Multimedia and Internet The course will cover principles and technologies for processing and network transmissions of multimedia signals, stereoscopy and visualizations in high definition. Lectures will include application areas of networked multimedia, transmission formats, interfaces, codecs, technologies for acquisition and reproduction of multimedia data and technologies for visualizations and distributed collaboration using networking and immersive environments. MI-MBI.16 Management of Business Informatics This course is presented in Czech. MI-MCS ΚZ Multicore Systems Students understand architecture of systems based on multicore processors with multiple threads per core, structure and usage of cache hierarchy with shared last level. They learn parallel algorithm classification, parallel programming technics, simulation and monitoring tools for measurement and optimization of parallel algorithms. After this course, students can design MTMD programs (Multiple Threads Multiple Data), measure and analyze latency and throughput of parallel algorithms and optimize them for contemporary multicore systems. MI-MDW.16 Web Services and Middleware Z,ZK 5 Students learn new trends and technologies in the area of service-oriented architectures, web services, middleware, and cloud computing, including their theoretical background. MI-MEP.16 Modelling of Business Processes Z.ZK 5 The subject is focused on introduction to the discipline of Enterprise Engineering. Students learn the importance of a proper methodological approach for (re)engineering and implementation of processes, organisation structures and information support in big enterprises and institutions. MI-MKY.16 Mathematics for Cryptology 5 Students become familiar with parts of mathematics necessary for deeper understanding of the methods used in symmetric and asymmetric cryptography. They learn the mathematical principles on which security of encryption systems, cryptanalysis methods, cryptography over elliptic curves, and quantum cryptography are based. MI-MPC Modern programming in C++ 5 Students learn how to use the modern features of contemporary versions of the C++ programming language for software development. The course focuses on programming effectivity and efficiency in the form of writing maintainable and portable source code and creating correct programs with low memory and processor time requirements. Mathematics for Informatics The course comprises topics from general algebra with focus on finite structures used in computer science. It includes topics from multi-variate analysis, smooth optimization and multi-variate integration. The third large topic is computer arithmetics and number representation in a computer along with error manipulation. The last topic includes selected numerical algorithm and their stability analysis. The topics are completed with demonstration of applications in computer science. The course focuses on clear presentation and argumentation. Master Project 1. At the beginning of the semester, a student reserves her/his final thesis topic and gets together with its supervisor. Together they decide on partial tasks that should be carried out during the semester. If the requirements they agreed upon are met, the supervisor awards the student an assessment for the course MI-MPR at the end of the semester. 2. External Master these (MT) supervisor fills his/her assessment into the paper "Form to award assessment by an external Final theses (FT) supervisor" (for the courses BIE-BAP, MIE-MPR, MIE-DIP). Students, then, ensure that the assessment is registered into the information system (IS) by asking their internal FT opponent to award the assessment to the IS based on the confirmation of the external MT supervisor. In the case the FT opponent is external as well, the assessment will be registered to the IS by the head of the department responsible for the topic of the MT. 3. If the FT topic that the student has reserved is rather general, the immediate tasks the supervisor assigns to the student for the upcoming semester should aim at fine-tuning the FT topic so that the FTT will be complete and approvable at the end of the semester. MI-MPX Management practice 7 4 The Student can once, within its master's degree graduate (to apply) management practices in the selected subject of practice (business subject) on the operational, tactical or strategic level of management (typically at the position of project manager, middle or top manager). The selected subject of practice and professional filling is assessed well in advance the course guarantor. In the selected subject of practice may not have a substantial ownership interest or substantial decision-making influence of the relatives of the student (e.g. as a member of the top management). MI-MSI Mathematical Structures in Computer Science Z.ZK Mathematical semantics of programming languages. MI-MTI.16 Z.ZK Modern Internet Technologies 5 Students learn technologies of the modern Internet. links of the IP technology to the modern communication networks, mechanisms for multicasting and real-time communication, more efficient mechanisms of virtual channels, and the new IPv6 architecture. They will understand the issues of monitoring and management of large computer networks. They are introduced to the technologies of interconnection networks for HPC systems. MI-MVI.16 Computational Intelligence Methods 5 Students will understand methods and techniques of computational intelligence that are mostly nature-inspired, parallel by nature, and applicable to many problems. They will learn how these methods work and how to apply them to problems related to data mining, control, intelligen games, optimizations, etc. MI-MZI Z,ZK Mathematics for data science In this course, students are introduced to those fields of mathematics that are necessary for understanding standard methods and algorithms used in data science. The studied topics include mainly: linear algebra (matrix factorisations, eigenvalues, diagonalization), continuous optimisation (optimisation with constraints, duality principle, gradient methods) and selected notions from probability theory and statistics.

MI-NFA.16 Design for the FPGA and ASIC Technology Z,ZK 5 Students gain the basic knowledge needed to start a career in a design house. They will understand the FPGA and ASIC implementation technologies and the limitations that the technologies impose on the design. They are able to perform and to manage typical workflows, their analytic and synthetic steps, with an emphasis on basic verification. They know the structure and demands of software tools, as well as what to expect from them. MI-NSS.16 Normalized Software Systems 7K 5 Students will learn the foundations of Normalized Systems theory, which studies the evolvability of modular structures based on concepts from engineering such as stability from systems theory and entropy from thermodynamics. Initially, the theory was developed at the level of software architectures, where the concept of stability was translated into the definition of so-called combinatorial effects. These effects occur when the impact of a change to the software architecture is dependent on the change itself, as well as on the size of the system. The latter is highly undesirable, as it will cause even a simple change to incur an ever-increasing impact as the size of the system grows over time. As such, combinatorial effects can be considered as a main cause of Lehman?s Law of Increasing Complexity (see, e.g., http://en.wikipedia.org/wiki/Lehman's_laws_of_software_evolution). Additionally, the concept of entropy was used in the study of which micro-states in a modular structure correspond with a given macro-state. This is related mainly to issues such as testing in software architectures. Normalized Systems theory consists first of a set of principles which indicate where violations of stability and entropy-related issues occur in any given software architecture. These principles indicate that very fine-grained modular structures are required in order to control them. In the second part of the theoretical framework, it is shown how software architectures can be constructed based on a set of 5 design patterns called elements. These elements provide the core functionality of information systems in terms of storing data, executing actions. workflows, connectors and triggers, while controlling for violations of the stability and entropy-related principles, allowing them to realize new levels of evolvability in software architectures. Recently, Normalized Systems theory was also applied to the modular structures in business processes and enterprise architectures, with the goal of constructing a foundational theory for Enterprise Engineering. MI-NUR.16 User Interface Design Z,ZK 5 Students will understand the theorical background of human-computer interaction and user interface (UI) design, will learn formal description of UIs, formal user models, the fundamental notions and procesures. They get acquainted with graphical, speech, and multimodal Uls. Thanks to the gained knowledge, the students will be able to design advanced Uls. Linux Drivers The Linux operating system is an important operating system for personal computer and also for embedded systems. Systems on chip and combining powerful processors and FPGAs increase the variability of peripheral subsystems requiring specific software drivers. This course is an advanced course in the Linux driver development for master's students. The course provides knowledge of Linux operating system architecture, principles of development of various types drivers, including practical experience. MI-PAA Problems and Algorithms 5 Students are able to evaluate discrete problems by complexity and by the purpose of optimisation (on-line tasks, multicriterial optimisation). They understand principles and properties of heuristics and exact algorithms and, therefore, are able to select, apply, and experimentally evaluate a suitable heuristics for a practical problem. MI-PAM Efficient Preprocessing and Parameterized Algorithms There are many optimization problems for which no polynomial time algorithms are known (e.g. NP-complete problems). Despite that it is often necessary to solve these problems exactly in practice. We will demonstrate that many problems can be solved much more effectively than by naively trying all possible solutions. Often one can find a common property (parameter) of the inputs from practice-e.g., all solutions are relatively small. Parameterized algorithms exploit that by limiting the time complexity exponentially in this (small) parameter and polynomially in the input size (which can be huge). Parameterized algorithms also represent a way to formalize the notion of effective polynomial time preprocessing of the input, which is not possible in the classical complexity. Such a polynomial time preprocessing is then a suitable first step, whatever is the subsequent solution method. We will present a plethora of parameterized algorithm design methods and we will also show how to prove that for some problem (and parameter) such an algorithm (presumably) does not exist. We will also not miss out the relations to other approaches to hard problems such as moderately exponential algorithms or approximation schemes. MI-PAP.16 Parallel Computer Architectures 5 The students gain a good overview of present parallel architectures and processors:parallel (ILP) microarchitectures, multithreaded and multicore processors, SoCs and MPSoCs, GPUs, and neural processors. Students also get hands-on experience with programming these systems. MI-PCM.16 ΚZ Project And Change Management 3 This course is presented in Czech. MI-PDB.16 Advanced Database Systems Z,ZK 5 Students orient themselves in problems of evaluation and optimization of SQL queries. The next part of the course deals with new concepts of database machines (so called NoSQL databases), with the related new data models (XML, graph databases, column databases) and languages for working with them (XQuery, XPath, CYPHER, Gremlin). The last part of the course deals with performance evaluation of database machines. MI-PDD.16 Data Preprocessing Students learn to prepare raw data for further processing and analysis. They learn what algorithms can be used to extract parameters from various data sources, such as images, texts, time series, etc., and learn the skills to apply these theoretical concepts to solve a specific problem in individual projects - e.g., parameter extraction from image data or from Internet. Parallel and Distributed Programming MI-PDP16 7.7K Due to the development of cloud, web, and communication technologies and due to the shift of the Moore law into multicore and manycore CPUs, parallel and distributed applications are becoming ubiquitous. Students get acquainted with architectures of parallel and distributed computing systems, their models, theory of interconnection networks, and languages and environments for parallel programming of shared and distributed memory computers. On selected problems, they will learn the techniques of design of efficient and scalable parallel algorithms and methods of performance evaluation of their implementations. MI-PIS.16 **Advanced Information Systems** Students learn the notion of business process logic and its formalization, with business process roles, business rules, and data processing, with the notion of service oriented company, enterprise services and service solution of business logic. They get acquainted with these notions also for the other types of ISs. They learn about agility and adaptivity and using of artificial intelligence methods for implementation of these ideas in ISs. They understand modern object-oriented methodologies for modelling of business processes, business rules, processed data, and enterprise ISs. They will get the rules and technologies for successful implementation of IS. MI-POA.16 Advanced Computer System Architectures Z.ZK 5 The student will learn the current trends in infrastructure architecture of complex business computer systems. After completion of the module, the student will be able to design a complex system infrastructure that meets availability and scalability requirements given by the business environment. MI-PRC Programming in CUDA Z,ZK 4 The students gain a good overview of present parallel architectures in GPUs. Students also get hands-on experience with programming these systems. MI-PSL Z,ZK Programming in Scala 4 The course introduces the modern programming language Scala which exploits object-functional paradigm. Scala comprises advance language features - e.g.pattern matching and advance standard library. Scala enables to use of applications functional patterns e.g. H-List, Monads, etc. Scala is used by many powerful frameworks and libraries e.g. Play, Cassandra, Scalaz, etc. MI-PVR Advanced Virtual Reality ΚZ The course introduces advanced parts of the virtual reality. It is a continuation of the already running graphic objects, especially the creation of 3D models in Blender, and among other things, it introduces students to their application in virtual reality. Lectures will focus on virtual reality technology, its use in various applications and will also deal with creating applications in available 3D engines (mainly Unity3D). The course is freely connected with the subject VHS (virtual game worlds), students will be able to apply the knowledge gained in this subject in virtual reality, or directly create a complex game for VR.

MI-PVS Advanced embedded systems Z,ZK The course is focused on ARM processors and microcontrollers and their usage in wide range of applications. The course includes a series of advanced topics like security support, working with mass storage devices, motor control, system control and industrial communication. The students obtain both theoretical and also practical experiences with embedded systems. MI-PYT ΚZ Advanced Python 4 The goal of this course is to learn various advanced techniques and methods in Python. The course indirectly continues where Programming in Python (BI-PYT) left of. The course is very hands-on and it has only tutorials, everything is demonstrated on examples. Classification is based on work in class as well as semestral coursework. The course is lead by external teachers from Red Hat. MI-REV.16 Reverse Engineering Z,ZK Students will get acquainted with the essentials of reverse engineering of computer software. They will learn how processes start and what happens before and after the main function is called. Students will understand how executable files are organized and how they interact with 3rd party libraries. Another part of the course is dedicated to reverse engineering of applications written in C++. Students will also understand principles of disassemblers and obfuscation techniques. A part of the course will also be dedicated to debuggers: how debuggers and debugging work and which methods can be used to detect it. One of the lectures will be dedicated to the latest trends on the computer malware scene. The focus of the course is on the seminars, where students will solve practically oriented tasks from the real world. Pattern Recognition Z,ZK The aim of the module is to give a systematic account of the major topics in pattern recognition with emphasis on problems and applications of the statistical approach to pattern recognition. Students will learn the fundamental concepts and methods of pattern recognition, including probability models, parameter estimation, and their numerical aspects MI-RRI Risk Management in Informatics Information security is very often considered as one of main objectives to secure targets of information processing. However, to focus on this info security as a matter of protection of IT systems against viruses, malware etc. very often means misunderstanding and underestimating of real threats which are around us and which are more dangerous then viruses and other malware. The necessity to continue with business after disaster is also slightly ignored. International standards which are focused on informatics and information security just during last years started to anticipate necessity of risk management. There is no commonly accepted methodology used for this task. Threats which are currently possible to see worldwide, invoke pressures to prepare plans for business continuity management even in the case of dramatic political changes, natural disasters etc. MI-RUB K7 4 Programming in Ruby This course is presented in Czech. MI-SCE1 Computer Engineering Seminar Master I Ζ 4 The Seminar of Computer Engineering is a (s)elective course for students who want to deal with deeper topics of digital design, reliability and resistance to failures and attacks. Students are approached individually within the subject. Each student or group of students solves some interesting topic with the selected supervisor. Part of the subject is work with scientific articles and other professional literature and/or work in K N laboratories. The capacity of the subject is limited by the possibilities of the seminar teachers. The topics are new for each semester. MI-SCE2 Computer Engineering Seminar Master II The Seminar of Computer Engineering is a (s)elective course for students who want to deal with deeper topics of digital design, reliability and resistance to failures and attacks. Students are approached individually within the subject. Each student or group of students solves some interesting topic with the selected supervisor. Part of the subject is work with scientific articles and other professional literature and/or work in K N laboratories. The capacity of the subject is limited by the possibilities of the seminar teachers. The topics are new for each semester. MI-SCR Statistical Analysis of Time Series The course deals with the practical use of the basic time series modelling theory in engineering tasks, ranging from economics (stock exchange prices, employment) and industrial problems (modelling of signals and processes) to computer networks (network components load, attacks detection). The students learn to select a convenient process model, estimate its parameters, analyze its properties and use it for forecasting of future or intermediate values. The stress is put on understanding and adoption of the main principles based on practical real-world examples. Both the lab classes and the lectures exploit freely available software packages in order to provide easy and straightforward transfer of students' knowledge from the academic to the real world. MI-SEP World Economy and Business Z.ZK This course is presented in Czech. However, there is an English variant in the program Informatics (N1801 / 4793). The course introduces students of technical university to the international business. It does that predominantly by comparing individual countries and key regions of world economy. Students get to know about different religions and cultures, necessary for doing business in diverse societies as well as indexes of economic freedom, corruption and economic development, which are needed for the right investment decision. Seminars help to improve on the knowledge in the form of discussions based on individual readings. It is advised to take bachelor level of this course BIE-SEP as a prerequisite. **Network Security** The students will gain theoretical and practical knowledge and experience in the area of current security threats in computer networks, specifically about detection and defense. The course explains basic pricipals of security monitoring, packet-based and flow-based analysis, in order to detect anomalies and suspicious network traffic. The course focuses on explanation and practical examples of various mechanisms of securing network infrastructure and detection in real time. The course covers general principals of handling detected security events (i.e. incident handling and incident response). MI-SML16 Strategic Management of Informatics 7.7K The course focuses on the strategic management of information systems. Students will learn the process of creation and implementation of an information strategy, IT governance, the importance of ICT for business and interrelations between information strategies and lobal business strategies. Furthermore, they gain the knowledge in the areas of economic management of IS/IT, management of investments and ROI, assessment of IT investments and management of human resources in IT (the role of CIO, CEO, CFO). The part of the course is the role of project management, risk management and quality assessment of informatics. MI-SOC.16 Systems on Chip Z,ZK Students gain key knowledge and skills in the design of large-scale digital systems. They will be familiar with architectures of such systems and communication among their parts. They will use an appropriate workflow to design these architectures, their hardware and software. They will also have knowledge of contemporary methods of large systems verification and fault-tolerant systems design. MI-SPI.16 Statistics for Informatics Z,ZK 7 Summary of probability theory; Multivariate normal distribution; Entropy and its application to coding; Statistical tests: T-tests, goodness of fit tests, independence test; Random processes - stacionarity; Markov chains and limiting properties; Queuing theory Semantic Web Students learn standards used for processing and sharing knowledge mainly in the area of web. They get used to designing and using knowledge models, knowledge representation, and practical aspects as publishing, sharing, exchange, and acquisition of knowledge on the web. The presentation is based on the idea of the semantic web, including its standards and technologies (RDF, RDFS, OWL) and formal models. System Security Students will familiarize themselves with the actual ICT security needs in all ICT disciplines. Students will gain knowledge of typical network attacks and protection against them, together with essential communication encryption techniques. They will learn how to work with certain aspects of encryption techniques - passwords and certificates. After that, students will learn the basics of anti-virus, anti-spam and heuristic analyses used in modern anti-virus solutions or Unified Threat Management (UTM) based solutions. They will also learn the

principles of securing websites, web applications and databases. Upon completion of the module, students will have a broad overview of IT security and will be able to apply it to the integration of various software systems and applications. 7 MI-SZ1 Knowledge Engineering Seminar Master I 4 On this seminar you will present a research paper from a top institute / research group to your peers. You will learn what is being cooked in top research labs around the world. Additionally, you will learn how to properly present and read scientific papers. The work in the seminar will prepare you to attend (and profit from) top machine learning and AI conferences and summer schools, as well as FIT's own Summer Research Program (VyLet). Z,ZK MI-TES.16 Systems Theory Today, humankind has the ability to develop systems of incredible complexity (e.g., trains, microprocessors, airplanes, nuclear power plants). However, the costs of managing this complexity and of ensuring the correct behavior of a given system have become critical. A key technique for mastering this complexity is the usage of models that describe only those aspects of the systems that are important for the task at hand, and automated tools for analyzing those models. This subject will present theory and algorithms that form the basis for the modeling and analysis of complex systems. MI-TNN Theory of Neural Networks In this course, we study neural networks from the point of view of the theory of function approximation and from the point of view of probability theory. At first, we recall basic concepts pertaining to artificial neural Networks, such as neurons and connections between them, types of neurons from the point of view of signal transmission, network topology, somatic and synaptic mappings, network training, and the role of time in neural networks. In connection with network topology, we get acquainted with its transformation into a canonical topology, and in connection with somatic and synaptic mappings, with their composition into mappings computed by the Network, Finally in connection with training, we pay attention to the problem of overtraining and to the fact that training is actually a specific optimization task, recalling the most typical objective functions and the most important optimization methods employed for neural network training. We will see the meaninig of all these concepts in the context of common kinds of forward neural networks. Within the topic approximation approach to neural networks, we first notice the connection of neural networks to expressing functions of many variables using functions of fewer variables (Kolmogorov theorem, Vituškin theorem). Afterwards, we will see how the universal approximation capacity of neural networks can be mathematically formalized as the sets of mappings computed by neural networks being dense in important Banach spaces of functions, in particular in the spaces of continuous functions, spaces of functions integrable with respect to a finite measure, spaces of functions with continuous derivatives, and Sobolev spaces. Within the topic probabilistic approach, we first get acquainted with training based on expectation and training based on a random sample, and with probabilistic assumptions about training data with which those two kinds of neural networks can be employed. We will see how it is possible to get an estimate of the conditional expectancy of network outputs conditioned by its inputs using the expectancy based learning. We recall the strong and the weak law of large numbers and get acquainted with an analogy of the strong law of large numbers for neural networks and with the assumptions for its validity. Finally, we recall the central limit theorem, get acquinted with its analogy for neural networks, with the assumptions for its validity and with the hypothesis tests based on it. We will see how those tests can be employed to search for the topology of the network. MI-TS1 Theoretical Seminar Master I Theoretical seminar is intended for students which want to come in deeper contact with contemporary theoretical computer science. It is mostly a classical reading group. The students are treated individually and concern themselves with interesting topics from the latest research in the area. Therefore, an integral part of the course is a work with scientific papers and other scholarly literature. The capacity is limited by the the potentials of the teachers of the seminar. MI-TS2 Theoretical Seminar Master II Theoretical seminar is intended for students which want to come in deeper contact with contemporary theoretical computer science. It is mostly a classical reading group. The students are treated individually and concern themselves with interesting topics from the latest research in the area. Therefore, an integral part of the course is a work with scientific papers and other scholarly literature. The capacity is limited by the the potentials of the teachers of the seminar. MI-TS3 Theoretical Seminar Master III Theoretical seminar is intended for students which want to come in deeper contact with contemporary theoretical computer science. It is mostly a classical reading group. The students are treated individually and concern themselves with interesting topics from the latest research in the area. Therefore, an integral part of the course is a work with scientific papers and other scholarly literature. The capacity is limited by the the potentials of the teachers of the seminar. MI-TS4 Theoretical Seminar Master IV Ζ Theoretical seminar is intended for students which want to come in deeper contact with contemporary theoretical computer science. It is mostly a classical reading group. The students are treated individually and concern themselves with interesting topics from the latest research in the area. Therefore, an integral part of the course is a work with scientific papers and other scholarly literature. The capacity is limited by the the potentials of the teachers of the seminar. MI-TSP.16 Z.ZK Testing and Reliability Students gain knowledge about circuit testing and about methods for increasing reliability and security. They will get practical skills to be able to prepare a test set with the help of the intuitive path sensitization and to use an ATPG for automatic test generation. They will be able to design easy testable circuits and systems with built-in-self-test equipment. They will be able to analyze and control reliability and availability of the designed circuits. MI-VEM Scientific thinking K7 2 The objective of the course is to get acquainted with scientific methods and discovery of order and laws of the universe, including the aspects of human life. The subject combines scientific methods in natural sciences, mathematics, computer science and humanities. Another aim is to introduce rules and requirements of scientific communication via research papers and posters. MI-VMM.16 Retrieval from Multimedia Z,ZK 5 The student obtains general knowledge regarding interfaces of portals providing multimedia content, the principles of similarity search, the methods of feature extraction from multimedia objects, indexing, and structure of distributed search engines. MI-VYC Z,ZK 4 Computability Classical theory of recursive functions and effective computability, with applications in provability theory. MI-W20.16 Web 2.0 Z.ZK 5 Students will learn new trends and technologies on the Web including theoretical foundations. Students will gain an overview about Web applications architectures, concepts and technologies about programmable Web (REST Architectures, Mashups), basic mechanisms for knowledge representation on the Web (microformats, meta-data, ontologies, open linked data, etc.), mechanisms about collective intelligence (collaborative filtering, predictions of users' behaviours), social networks, and security. MI-ZS10 Master internship abroad for 10 credits 10 Each student can once within his / her master's degree have a foreign internship at a foreign university or other foreign scientific and/or research institution. Before the internship the Dean of the FIT, or the vice-dean for study affairs assesses the professional content. The student must provide evidence of the professional content and extent of the internship, Auxiliary courses MI-ZS10, MI-ZS20, MI-ZS30 are used used for the evidence and evaluation of the internship in IS KOS. Every 10 credits correspond to 4 weeks of full-time employment with a foreign institution. The maximum number of credits a student can earn for one internship is 30 credits. This amount can be divided into two subjects if the internship exceeds the academic year's dead-line. MI-ZS20 Master internship abroad for 20 credits 20 Each student can once within his / her master's degree have a foreign internship at a foreign university or other foreign scientific and/or research institution. Before the internship the Dean of the FIT, or the vice-dean for study affairs assesses the professional content. The student must provide evidence of the professional content and extent of the internship. Auxiliary courses MI-ZS10, MI-ZS20, MI-ZS30 are used used for the evidence and evaluation of the internship in IS KOS. Every 10 credits correspond to 4 weeks of full-time employment with a foreign institution. The maximum number of credits a student can earn for one internship is 30 credits. This amount can be divided into two subjects if the internship exceeds the academic year's dead-line.
