Recomended pass through the study plan

Name of the pass: Bachelor specialization Computer Systems and Virtualization, part-time, in Czech, 2021

Faculty/Institute/Others:

Department:

Pass through the study plan: Bachelor specialization Computer Systems and Virtualization, part-time, in

Czech, 2021

Branch of study guranteed by the department: Welcome page

Guarantor of the study branch: Program of study: Informatika Type of study: Bachelor combined

Note on the pass: Vedle ist volitelných p edm t si m žete zapsat jako volitelné p edm ty i povinné p edm ty sousedních specializací. Chcete-li splnit skupinu "BI-ZKA.21 Zkouška z angli tiny 2021" p edložením certifikátu, který prokazuje vaši znalost angli tiny srovnatelnou nebo p evyšující úrove B2 Spole ného evropského referen ního rámce pro jazyky, m žete tak u init v kterémkoliv aktivním semestru b hem studia.

Coding of roles of courses and groups of courses:

P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV - compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

Number of semester: 1

Code	Name of the course / Name of the group of courses (in case of groups of courses the list of codes of their members) Tutors, authors and guarantors (gar.)	Completion	Credits	Scope	Semester	Role

List of courses of this pass:

Code	Name of the course		Credits
BI-ANG	English Language, Internal Certificate		2
·	Course information and teaching materials can be found at https://moodle-vyuka.cvut.cz/course/search.php?search=BI-AN	G	•
BI-ANG1	English Language Examination without Preparatory Courses	Z,ZK	2
BI-BAP.21	Bachelor Thesis	Z	14

BIE-EEC	English language external certificate	Z	4
	can be recognized for any active semester after the submission of a certificate certificate that demonstrates their proficiency in Englis		1
	the B2 level of the Common European Framework of Reference for Languages.		
BIK-AAG.21	Automata and Grammars	Z,ZK	5
	ced to basic theoretical and implementation principles of the following topics: construction, use and mutual transformations of finite a	_	-
nd regular grammar	rs, translation finite automata, construction and use of pushdown automata, hierarchy of formal languages. Knowledge acquired through the construction of the construc	ough the module	is applicabl
DUC ADULGA	to creation of algorithms for pattern matching, data compression, translation, simple parsing, and creation of digital circuits.	7.71	
BIK-ADU.21	Unix Administration	Z,ZK	5
	e internal structure of the UNIX operating system, with the administration of its basic subsystems and with the security principles. They will get theoretical and practical knowledge of user management and administration, of users access rights, f		
	y, network services and remote access, and in the areas of system deployment and virtualization. In the labs, they will verify the kno	•	•
	specific examples from practice.	J	
BIK-ADW.1	Windows Administration	Z,ZK	4
	This course is presented in Czech.	·	'
BIK-AG1.21	Algorithms and Graphs 1	Z,ZK	5
	sented in Czech. The course covers the basics from the efficient algorithm design, data structures, and graph theory, belonging to the		
	n. Students learn techniques of proofs of correctness of algorithms and techniques of asymptotic mathematics for estimation of their		
r average case (the	course includes basics from probability theory needed for understanding randomized algorithms). Within exercises students learn app	lications of studi	ed algorithm
BIK-APS.21	for solving practical problems.	Z,ZK	5
	Architectures of Computer Systems the construction principles of internal architecture of computers with universal processors at the level of machine instructions. Speci		_
	processing and on the memory hierarchy. Students will understand the basic concepts of RISC and CISC architectures and the princ		
not only in scalar p	processors, but also in superscalar processors that can execute multiple instructions in one cycle, while ensuring the correctness of	the sequential m	nodel of the
rogram. The course	further elaborates the principles and architectures of shared memory multiprocessor and multicore systems and the memory coherence.	ence and consis	tency in suc
	systems.		
BIK-AWD.21	Web and Database Server Administration	Z,ZK	5
	uainted with the administration of database and web servers and services. They will be able to install, configure, operate, test, and b		
	e systems. The principles will be demonstrated on the PostgreSQL relational database engine and Apache will be used as an exam		
BIK-BIG.21	DB Technologies for Big Data	KZ	5
	duced into the field of Big Data processing where nonrelational (NoSQL) database engines are typically used today. The course is fo students were able to choose suitable tools (mostly open source) and techniques,design and implement a simplest reproducible me		
	ation/aggregation, presentation). Students get acquainted with various architectures for processing and storing big data. A theoretica		
onconon, transforme	of individual technologies will be supplemented with specific case studies.	ii louridation and	i procontatio
BIK-BPR.21	Bachelor project		
		Z	1

BIK-LA1.21 Linear Algebra 1 Z,ZK 5 We will introduce students to the basic concepts of linear algebra, such as vectors, matrices, vector spaces. We will define vector spaces over the field of real and complex numbers and also over finite fields. We will present the concepts of basis and dimension and learn to solve systems of linear equations using the Gaussian elimination method (GEM) and show the connection with linear manifolds. We define the regularity of matrices and learn to find their inversions using GEM. We will also learn to find eigenvalues and eigenvectors of a matrix. We will also demonstrate some applications of these concepts in computer science. BIK-MA1.21 Mathematical Analysis 1 We begin the course by introducing students to the set of real numbers and its properties, and we note its differences with the set of machine numbers. Then we study real sequences and real functions of a real variable. We gradually introduce the notions of limits of sequences and functions, continuous functions, and derivatives of functions. This theoretical foundation is then applied to root-finding problems (iterative method of bisection and Newton's method), construction of cubic interpolation (spline), and formulation and solution of simple optimization problems (i.e., the issue of finding extrema of functions). The course is closed with the Landau's asymptotic notation and methods of mathematical description of complexity of algorithms. BIK-MA2.21 Mathematical Analysis 2 The course completes the theme of analysis of real functions of a real variable initiated in BIK-MA1 by introducing the Riemann integral. Students will learn how to integrate by parts and use the substitution method. The next part of the course is devoted to number series, and Taylor polynomials and series. We apply Taylor's theorem to the computation of elementary functions with a prescribed accuracy. Then we study the linear recurrence equations with constant coefficients, the complexity of recursive algorithms, and its analysis using the Master theorem. Finally, we introduce the student to the theory of multivariate functions. After establishing basic concepts of partial derivative, gradient, and Hessian matrix, we study the analytical method of localization of local extrema of multivariate functions as well as the numerical descent method. We conclude the course with the integration of multivariate functions. This course can be enrolled only after successful completion of the course BIK-MA1, which can be replaced by the course BIK-ZMA in the case of repetitive students. **BIK-OOP** Object-Oriented Programming Z,ZK 4 This course is presented in Czech. Object-oriented programming has been used in the last 50 years to solve computational problems by using graphs of objects that collaborate together by message passing. In this course we look at some of the main principles of object-oriented programming and design. The emphasis is on practical techniques for software development including testing, error handing, refactoring and design patterns. BIK-OSY.21 Operating Systems In this course that is a follow-up of the Unix-like operating systems course students deepen their knowledge in areas of OS kernels, process and thread implementations, race conditions, critical regions, thread scheduling, shared resource allocation and deadlocks, management of virtual memory and data storages, file systems, OS monitoring. They are able to design and implement simple multithreaded applications. General principles are illustrated on operating systems Solaris, Linux, or MS Windows BIK-PA1.21 Programming and Algorithmics 1 Z,ZK 7 Students gain the ability to formulate algorithms for solving basic problems and write them in the C language. They understand data types (simple, structured, pointers), expressions, statements, functions, concept of recursion. They learn to analyse simple cases of algorithm complexity. They know fundamental algorithms for searching, sorting, and manipulating with linked lists. BIK-PA2.21 Programming and Algorithmics 2 Z,ZK Students know the instruments of object-oriented programming and are able to use them for specifying and implementing abstract data types (stack, queue, enlargeable array, list, set, table). They learn these skills using the C++ programming language and are introduced to all C++ features needed in object-oriented programming (e.g., template programming, copying/moving of objects, operator overloading, inheritance, polymorphism). **BIK-PJV** Programming in Java Z,ZK 4 This course is presented in Czech. However, there is an English variant in the full-time program Informatics (B1801 / 4753) **BIK-PKM** Introduction to Mathematics Z 4 This course is presented in Czech. BIK-PRR.21 Z,ZK Project management 5 Project management not only as a common dictionary and setting necessary processes while preparing and / or managing projects, but also as a social art. 20 years of experience not only in IT in various positions and different projects available at your hands. BIK-PSI.21 Computer Networks Z,ZK The course introduces students to the principles of computer networking. It covers basic technologies, protocols, and services commonly used in local networks and in the Internet as well. The lectures will be amended by proseminars that introduce students into network programming and demonstrate the abilities of advanced network technologies. Students practically verify configurations and management of network devices in the lab within the environment of the operating systems Linux and Cisco IOS. BIK-PST.21 Probability and Statistics Z,ZK Students will learn the basics of probabilistic thinking, the ability to synthesize prior and posterior information and learn to work with random variables. They will be able to apply basic models of random variable distributions and solve applied probabilistic problems in informatics and computer science. Using the statistical induction they will be able to perform estimations of unknown distributional parameters from random sample characteristics. They will also be introduced to the methods for testing statistical hypotheses and determining the statistical dependence of two or more random variables. BIK-SAP.21 Computer Structure and Architecture Z,ZK 5 Students will get acquainted with the basic architecture and units of a digital computer, understand the structure, function, and implementation of arithmetic-logic unit, controllers, memory, I/O communication, methods of data transfers between the units. The logic design and the implementation of a program-controlled simple processor is practically implemented in the labs using programmable circuits (FPGA), a single-chip microcomputer, and modern design (EDA) tools. BIK-SPS.21 Administration of Computer Networks and Services Z,ZK The aim of the course is to deepen the theoretical knowledge of network technologies and protocols in the environment of network servers administrated under the operating systems Linux and Windows. The course syllabus requires the knowledge at the level of courses BIE-PSI, BIE-VPS, and BIE-OSY. Practical skills will be gained by practical hands-on experience with real network infrastructure. BIK-SQL.1 Language SQL ΚZ Course is based on knowledge obtained in BI-DBS. Students become familiar with advanced relational and non-relational features of SQL language. In particular stored program unites, triggers, recursive queries, OLAP support, object-relational constructions. Part of the course is dedicated to practical database optimization from the point of view of specialized database structures like indexes, clusters, index-organized tables, and materialized views. as well as from the point of view query optimization. Execution plan and possibilities of its. changes will be discussed. Lectures will usually discuss SQL standard, but many features will be demonstrated on Oracle DBMS. Seminars are based on Oracle DBMS and partially on PostgreSQL. **BIK-STO** Storage and Filesystems Z,ZK 4 The student will learn principles and current solutions of storage systems architecture. The module explains principles of data store, protection, and archiving, as so as storage scaling, load balancing and high availability. Z,ZK BIK-TAB.21 Applications of Security in Technology 5 The goal of the course is to introduce students to selected topics from cybersecurity technical applications that are utilized in different industries. Students get a broader overview of cybersecurity applications and extend their knowledge from the cryptology, the secure code, and system, network, and hardware security. BIK-TDP.21 **Documentation and Presentation** The course is focused on the basics of creating electronic documentation with emphasis on the creation of technical reports of a larger scope, typically final university theses. Students learn to create text of a technical report in the LaTeX system, process an electronic presentation using the LaTeX Beamer system, and practically present it in front of classmates and the teacher. The course is intended primarily for those students who have chosen the topic of their bachelor's thesis or will choose it within the first 14 days of teaching. Within the exercises of the course, an active approach to the creation of individual parts of the bachelor's thesis is assumed.

BIK-TUR.21 User Interface Design

Students gain a basic overview of methods for designing and testing common user interfaces. They get experience to solve the problems where software and other products do not communicate with the user optimally, since the needs and characteristics of users are not taken into account during product development. Students gain an overview of methods that bring users into the development process to ensure optimal interface for them.

BIK-TZP.21 Technological Fundamentals of Computers Z,ZK 5

Students get acquainted with the fundamentals of digital and analog circuits, as well as basic methods of analyzing them. Students learn how computer structures look like at the lowest level. They are introduced to the function of a transistor. They will understand why processors generate heat, why cooling is necessary, and how to reduce the consumption; what the limits to the maximum operating frequency are and how to raise them; why a computer bus needs to be terminated, what happens if it is not; how a computer power supply looks like (in principle). In the labs, students model the behavior of basic electrical circuits in SW Mathematica.

BIK-UOS.21 Unix-like Operating Systems KZ 5

Unix-like operating systems represent a large family mostly open-source codes that kept bringing during the history of computers efficient innovative functions of multiuser operating systems for computers and their networks and clusters. The most popular OS today, Android, has a unix kernel. Students get overview of basic properties of this OS family, such as processes and threads, access rights and user identity, filters, or handling files in a file system. They learn to use practically these systems at the level of advanced users who are not only able to utilize powerful system tools that are available to users, but are also able to automatize routine agenda using the unix scripting interface, called shell.

BIK-VDC.21 Virtualization and Data Centers Z,ZK 5

The aim of the course is to familiarize students with technology basis of cloud computer systems. It shows principles and techniques used in design and implementation of data center infrastructure, such as various kinds of virtualization and high availability of servers, storages, and software layers. The course guides through data center technologies from private to public and hybrid clouds. Student learn current trends in the architecture of IT infrastructure and its configuration for classic and cloud applications. Students will understand the design, validation, and operation of complex infrastructures for modern applications with respect to scalability and protection against overloads, outages, and data losses.

BIK-VES | Embedded Systems | Z,ZK | 5
Students learn to design embedded systems and develop software for them. They get basic knowledge of the most common microcontrollers and embedded processors, their integrated

peripheral circuits, programming methods, and applications. They get practical skills with development kits and tools.

BIK-VPS.21 Selected Topics in Computer Networking Z,ZK 5

The course builds upon the Computer Networks course (BI-PSI), obligatory for the program. Students will learn in detail principles, protocols, and technologies used in modern computer networks from local area networks up to Internet, with focus on switching, routing, security, and virtualization. The emphasis will be on gaining practical experience with real network devices in the lab and learning important methods of local area and wide area networks from the viewpoint of functionality, performance, and security.

BIK-ZSB.21 Basics of System Security Z,ZK 5

The goal of the course is to provide introduction to basic concepts in security of computer systems. Further, the course introduces the basics of forensic analysis and related topics such as malware analysis or incident response. After finishing the course student will get both theoretical and practical knowledge in the area of modern operating systems security, as well as skills needed for independent work in the area of operating system security incident analysis.
