Recomended pass through the study plan

Name of the pass: Branch Robotics - Passage through study

Faculty/Institute/Others: Faculty of Electrical Engineering Department: Pass through the study plan: Cybernetics and Robotics - Robotics Branch of study guranteed by the department: Welcome page Guarantor of the study branch: Program of study: Cybernetics and Robotics Type of study: Follow-up master full-time Note on the pass:

Coding of roles of courses and groups of courses:

P - compulsory courses of the program, PO - compulsory courses of the branch, Z - compulsory courses, S - compulsory elective courses, PV - compulsory elective courses, F - elective specialized courses, V - elective courses, T - physical training courses

Coding of ways of completion of courses (KZ/Z/ZK) and coding of semesters (Z/L):

KZ - graded assesment, Z - assesment, ZK - examination, L - summer semester, Z - winter semester

Number of seme	ster: 1

List of courses of this pass:

Code	Name of the course	Completion	Credits
B3M33ARO	Autonomous Robotics	Z,ZK	7
The Autonomous	robotics course will explain the principles needed to develop algorithms for intelligent mobile robots such as algorithms for: (1) Mapping the second se	oing and localizatio	n (SLAM)
sensors calibration	(lidar or camera). (2) Planning the path in the existing map or planning the exploration in a partially unknown map and performing the p	olan in the world. IN	IPORTANT:
It is assumed that s	tudents of this course have a working knowledge of optimization (Gauss-Newton method, Levenberg Marquardt method, full Newton m	ethod), mathemati	cal analysis
(gradient, Jacobia	n, Hessian), linear algebra (least-squares method), probability theory (multivariate gaussian probability), statistics (maximum likeliho	od and maximum a	aposteriori
	estimate), python programming and machine learning algorithms.		
B3M33MKR	Mobile and Collective Robotics	Z,ZK	6
The course introd	uces a basic mobile robot structure design together with control methods aimed to achieve autonomous and collective behaviors for r	obots. Methods an	d tool s for
data acquisition	and processing are presented herein with the overall goal to resolve the task of autonomous navigation for mobile robots comprising	the tasks of sense	or fusion,
environmental mod	eling including Simultaneous Localization And Mapping (SLAM) approaches. Besides sensor-processing related tasks, methods for re	obot trajectory plar	nning will be
introduced. The cer	ntral topic of the course stands in specific usage of the afore methods capable of execution with groups of robots and taking the adva	ntage of their coop	eration and
coordination in grou	ips. Labs and seminars are organized in a form of an Open Laboratory whereas the students will implement some fundamental algorit	hms and study the	r properties
	on real data.		
B3M33PIS	Industrial Information Systems	Z,ZK	6
The aim of this cou	rse is to provide students with the necessary set of skills essential for the design and management of modern production systems. In	the first part of the	course, the
	about methods of modeling and simulation of discrete production systems. Students will then gain insight into methods for data analy	•	•
as well as into me	thods for process mining. The final part of the course deals with methods of data and knowledge modeling, which are necessary for	explicit capture an	d machine
	utilization of information and knowledge about production.		
B3M33PRO	Advanced robotics	Z,ZK	6
We will explain and	demonstrate techniques for modelling, analyzing and identifying robot kinematics. We will explain more advanced principles of the rep	resentation of mot	ion in space
and the robot desc	riptions suitable for identification of kinematic parameters from measured data. We will explain how to solve the inverse kinematic tas	k of 6DOF serial m	anipulators
a	nd how it can be used to identify its kinematic parameters. Theory will be demonstrated on simulated tasks and verified on a real indu	ustrial robot.	
B3M33UI	Artificial Intelligence	Z,ZK	6
The course deeper	s and enriches knowledge of AI gained in the bachelor course Cybernetics and Artificial Intelligence. Students will get an overview of	other methods use	d in AI, and
will get a hands-on	experience with some of them. They will master other required abilities to build intelligent agents. By applying new models, they will r	eiterate the basic	principles of
machine learning, t	echniques to evaluate models, and methods for overfitting prevention. They will learn about planning and scheduling tasks, and abou	t methods used to	solve them.

Student will also get ackquainted with the basics of probabilistic graphical models, Bayesian networks and Markov models, and will learn their applications. Part of the course will introduce students to the area of again populat neural networks, with an emphasis to new methods for deep learning.

	introduce students to the area of again populat neural networks, with an emphasis to new methods for deep learning.		
B3M35DRS	Dynamics and Control Networks	Z,ZK	6
	ponds to an ever-increasing demand for understanding contemporary networks – large-scale complex systems composed of many co		-
	o a single distributed entity. Herein, we will consider fundamental similarities between diverse areas such as e.g. forecasting the sprea	• •	
	nd manipulation of communities through social media, formation controls for unmanned vehicles, energy generation and distribution in prissues goes far beyond the boundaries of any single physical, technological or scientific domain. Therefore, we will analyze phenomer	-	-
	economic and biological networks. For such networked systems, the resulting behavior depends not only on the characteristics of the		
-	sical or logical interactions, but also on a precise way those components are interconnected – the detailed interconnection topology. F	-	
the course introd	uces fundamental theoretical and abstract computational network analysis concepts; in particular, the algebraic graph theory, network	measures and me	etrics and
fundamental netwo	ork algorithms. The second part of the course subsequently views networks as dynamical systems, studies their properties and ways	n which these are	controlled,
	using mainly methods of automatic control theory.		
B3M35LSY	Linear Systems	Z,ZK	. 8
	is course is to introduce mathematical tools for the description, analysis, and partly also synthesis, of dynamical systems. The focus w utput systems and their properties such as stability, controllability, observability and state realization. State feedback, state estimation,		
	explained in detail. Partially covered will be also time-varying and nonlinear systems. Some of the tools introduced in this course are real	-	-
	the analysis of controllability and observability in the design of flexible space structures, the design of state feedback in aircraft control		
variables. The main	motivation, however, is to pave the way for the advanced courses of the study program. The prerequsites for this course include unde	rgraduate level line	ar algebra,
	differential equations, and Laplace and z transforms.		
B3M35NES	Nonlinear Systems and Chaos	Z,ZK	6
-	urse is to introduce basics of the modern approaches to the theory and applications of nonlinear control. Fundamental difference when c	-	-
	with linear case is that the state space approach prevails. Indeed, the frequency response approach is almost useless in nonlinear co	-	
	dinary differential equations, therefore, an introduction to solving these equations is part of the course. More importantly, the qualitative m resented, among them Lyapunov stability theory is crucial. More specifically, the focus will be on Lyapunov function method enabling to		
	y that of linear ones. Furthemore, stabilization desing methods will be studied in detail, among them the so-called control Lyapunov fu		
	hod. Special stress will be, nevertheless, given by this course to introduce and study methods how to transform complex nonlinear mo		
more standard line	ear methods would be applicable. Such an approach is usually refered to as the so-called exact nonlinearity compensation. Contrary to	the well-known a	oproximate
linearization this r	method does not ignore nonlinearities but compensates them up to the best possible extent. The course introduces some interesting of	ase studies as we	ll, e.g. the
DOMOSOFD	planar vertical take off and landing plane ("planar VTOL"), or a simple 2-dimensional model of the walking robot.	7 71/	
B3M35OFD	Estimation, filtering and detection	Z,ZK	6
	wer description of the uncertainty of hidden variables (parameters and state of a dynamic system) using the probability language and an problem formulation principles of rational behavior under uncertainty will be analyzed and used to develop algorithms for paramete		
	s regression), filtering (Kalman filter) and detection (likelihood ratio theory). We will demonstrate numerically robust implementation of		
·	real life problems for the areas of industrial process control, robotics and avionics.	0 11	
B3M35ORR	Optimal and robust control	Z,ZK	6
B3M35PSR	Real -Time Systems Programming	Z,ZK	6
The goal of this co	burse is to provide students with basic knowledge about software development for real-time systems, for example in control and embe	dded applications.	The focus
	stems equipped with a real-time operating system (RTOS). Lectures will cover real-time systems theory, which can be used to formal		
-	nother set of lectures will introduce methods and techniques used for development of safety-critical systems, whose failure may have on the will first ack a converse of WW/acks BTOS and to be acknowled the word of the will first ack a converse of WW/acks BTOS and to be acknowled to the will be according to the word of the word o		-
-	ts will first solve a few simple tasks to familiarize themselves with basic components of VxWorks RTOS and to benchmark the used O cs represent the typical criteria for assessing the suitability of a given platform for the given application. After the simple tasks, studen		
	ritical motion control application which will require full utilization of RTOS features. All the tasks at the labs will be implemented in C (o		
B3M35SDU	Discrete Event Systems	Z,ZK	6
Discrete event syste	ems (DES) will be defined formally regarding their description and modelling. Students will learn to understand and use several ways of D		verification.
	The acquired knowledge will be evaluated at real (in most cases) industrial applications.		
B3M35SRL	Flight Control Systems	Z,ZK	6
	oted to classical and modern control design techniques for autopilots and flight control systems. Particular levels are discussed, starti	•	
angle stabilizers, to	o guidance and navigation systems. Next to the design itself, important aspects of aircraft modelling, both as a rigid body and conside are discussed.	ring flexibility of the	e structure,
B3M37KIN	Space Engineering	Z,ZK	6
	ints students with the basics of physics of the space environment and the technologies used in space systems, satellites, spacecrafts		
	and preparation of space missions. Subject matter includes a detailed description of the instrumentation of satellites and spacecrafts		
influences of the sp	ace environment, and analysis of instruments and systems for spacecratfts and methods of their testing. It provides a basic overview of	the trajectories of s	spacecrafts
and their application	ons. The course also covers optoelectronics in space systems, sensors used, their modeling and description. It discusses the principle	es of underlying ca	lculations,
	simulations and their processing.		
B3M37LRS	Aeronautical radio systems	Z,ZK	6
	duces students to the aeronautical radio engineering, aeronautical analogue, digital and satellite communication systems, aeronautica	al radio navigation	inciuaing
	a primary secondary and passive radiolocation. The course gets students theoretical and practical knowledge of the operation of the average of the presence of the	-	stems and

B3M38SPD	Data Acquisition and Transfer	Z,ZK	6		
The aim of the cours	e is to acquaint students with principles and limits of data transmission from sensors and similar sources of information for IoT and N	12M, wireless sens	or networks		
and specific algori	thms, respecting the limiting conditions of their function. The basic algorithms of distributed information processing in sensor networ	ks, as well as tech	nology for		
	energy harvesting for powering the wireless nodes of the network, will be studied.				
B3M38VBM	Videometry and Contactless Measurement	Z,ZK	6		
This course focuses	on CCD and CMOS video sensors, and optoelectronic sensors in general and their use in contactless videometric measurement sys	tems. Further optic	al radiation,		
its features, behavio	r and its use for acquiring object parameters, optical projection system, design of measurement cameras and processing of their sig	nal will be presente	ed. Students		
	will design, realize and debug an independent project - 'Optoelectronic reflective sensor', during labs.				
B3M38VIN	Virtual Instrumentation	Z,ZK	6		
B3M38ZDS	Z,ZK	6			
B3MPROJ8	33MPROJ8 Project				
B3MPVT		KZ	6		
Teamwork is the bas	sis of most of the activities that people perform in companies and their personal lives. In this course, students can try how to solve a	technical task in a	team, how		
to	cooperate, how to communicate together and how to solve problems such as project delays, how to include external influences in the	ne plan, etc.			
BDIP30	Diploma Thesis	Z	30		
Independent final c	omprehensive work for the Master's degree study programme. A student will choose a topic from a range of topics related to his or I	ner branch of study	, which will		
be specified by	y branch department or branch departments. The diploma thesis will be defended in front of the board of examiners for the compreh	ensive final examir	nation.		
BEZM	Safety in Electrical Engineering for a master's degree	Z	0		
The course provid	les for students of all programs periodic training guidelines for health and occupational safety and gives knowledge of electrical haza	ard of given branch	n of study.		
	Students receive indispensable qualification according to the current Directive of the Dean.				

For updated information see <u>http://bilakniha.cvut.cz/en/f3.html</u> Generated: day 2024-05-19, time 07:17.
